NTIS

Providing Permanent, Easy Access to U.S. Government Information

National Technical Information Service is the nation's largest repository and disseminator of governmentinitiated scientific, technical, engineering, and related business information. The NTIS collection includes almost 3,000,000 information products in a variety of formats: electronic download, online access, CD-ROM, magnetic tape, diskette, multimedia, microfiche and paper.

Search the NTIS Database from 1990 forward

NTIS has upgraded its bibliographic database system and has made all entries since 1990 searchable on **www.ntis.gov.** You now have access to information on more than 600,000 government research information products from this web site.

Link to Full Text Documents at Government Web Sites

Because many Government agencies have their most recent reports available on their own web site, we have added links directly to these reports. When available, you will see a link on the right side of the bibliographic screen.

Download Publications (1997 - Present)

NTIS can now provides the full text of reports as downloadable PDF files. This means that when an agency stops maintaining a report on the web, NTIS will offer a downloadable version. There is a nominal fee for each download for most publications.

1. OBJECTIVE AND SCOPE OF WORK

The goal of this research is to develop a better understanding of the mechanisms of formation of alcohols and other oxygenates from syngas over supported catalysts. Probe molecules will be added in situ during the reaction to help delineate reaction pathways and identify reaction intermediate species. The key of our study is to investigate how the species generated by these probe molecules interact with surface species present during oxygenate formation.

A reaction and analysis system capable of carrying out the experiments for this study was set up, modified, and tested^[1].

CO hydrogenation reactions are being carried out in both the presence and the absence of the probe molecule under conditions which favor the formation of oxygenated products. Nitromethane, acetylenic compounds, alcohols are possible choices as probe molecules for this study. The effectiveness of these probe molecules for the study of mechanisms of alcohol synthesis has to be determined experimentally based on different catalyst systems and reaction conditions.

One of the catalysts chosen for this investigation is $Co/Cu/ZnO/Al_{2O3}$. Detailed motivations for studying this system as well as using CH₃NO₂ as the probe molecule were given in the previous report^[2].

2. SUMMARY OF PROGRESS

(A) A Co(1 wt%)/Cu/ZnO/Al2O3 catalyst has been prepared by incipient wetness impregnation of the commercial Cu/ZnO/Al2O3 with cobalt nitrate.

(B) Activity and selectivity of this catalyst for CO hydrogenation were tested under different reaction conditions. Conditions under which reasonable amount of ethanol can be produced with relatively low hydrocarbon formation were chosen for the study of probe molecule addition.

(C) The effect of CH3NO2 addition to H2/CO (2:1) over Co/Cu/ZnO/Al2O3 was investigated.

3. DETAILED DESCRIPTION OF TECHNICAL PROGRESS

(A) Catalyst Preparation

5 g Cu/ZnO/Al2O3^[1] was impregnated with 4.3 ml of 2.8709 g Co(NO3)2.6H2O desolved in 50 ml H2O by incipient wetness technique to obtain a Co(1 wt%)/Cu/ZnO/Al2O3 catalyst. The impregnated sample was dried at 90 °C overnight in air. Then, it was reduced in flowing H2 (80 cc/min) at 300 °C for 8 hr. The temperature was ramped from 25 °C to 300 °C at 0.5 °C/ min. The catalyst was then passivated at 35 °C with 2% O2 in He for ~2 hr.

(B) Activity and Selectivity Tests

About 1 g of the Co/Cu/ZnO/Al2O3 catalyst was loaded in

the reactor for activity and selectivity tests. Before reaction, a re-reduction was performed in the reactor with about 5 % H2 in He (~80 cc/min) at 1 atm and 300 °C for 8 hr before cooling to the reaction temperature, 250 °C.

The CO hydrogenation reaction was first carried out at 300 psi with H2/CO/CO2 (80+40+6 cc/min[°]) reactant mixture at 250, 270, 290, 310, 330, and 350 °C. The product distribution in terms of C (CO+CO2) conversion (%) is shown in Figure 1. Significant amount of ethanol was produced in this temperature range. As temperature increased, more propanol and dimethylether were formed but C1-C6 linear hydrocarbons increased significantly. To study the effects of CH3NO2 addition on oxygenates formation the following conditions were chosen:

400 psi, 290 °C, H2/CO ratio of 2 with or without CO2.

(C) Effects of CH3NO2 Addition

The effects of CH3NO2 addition to the steady state of CO hydrogenation reaction were investigated at 290 °C and 400 psi with, first, H2/CO/CO2 (B0+40+6 cc/min), then, H2/CO/He (80+40+6 cc/min). The effect of CH3NO2 addition on the distribution of the major products, e.g. CH3OH, C2H5OH, (CH3)2O, CH4 and C2H6, is shown in Figure 2. CH3OH and (CH3)2O were significantly suppressed upon CH3NO2 addition but not C2H5OH. CH4 increased with the addition of CH3NO2 but not C2+ hydrocarbons. As shown in Figure 3, CH3NO2 added to the reaction was completely converted to (CH3)3N over Co/Cu/ZnO/ Al2O3. Results from repeating the same reaction showed that

addition of CH3NO2 does not poison the catalyst under the selected conditions. (CH3)3N leaves the surface completely in about an hour (see Figure 4).

The selective interaction of CH3NO2 with the CO hydrogenation products raises intriguing questions about the dynamic surface, for example,

- How is CH3NO2 converted into (CH3)3N? Which intermediate or surface species in the CO hydrogenation is involved in the (CH3)3N formation?

- Why does the conversion of CH3NO2 to (CH3)3N only suppress CH3OH and (CH3)2O significantly but not C2+ alcohols? Does C2H5OH as well as C3H7OH formation involve the same intermediate as CH3OH and (CH3)2O formation?

- Why does conversion to CH4 increase upon CH3NO2 addition? Is it caused by breaking of the C-N bond in CH3NO2?

Answers to these questions could be very helpful in distinguishing which intermediate(s) is (are) involved in the various reaction pathways.

4. PLANS FOR THE NEXT REPORTING PERIOD

Further experiments with both $Co/Cu/ZnO/Al_{2O3}$ and $Cu/ZnO/Al_{2O3}$ catalysts have been designed for the next reporting period in order to answer some of the questions raised in the previous section.

This report was printed specifically for your order from nearly 3 million titles available in our collection.

For economy and efficiency, NTIS does not maintain stock of its vast collection of technical reports. Rather, most documents are custom reproduced for each order. Documents that are not in electronic format are reproduced from master archival copies and are the best possible reproductions available.

Occasionally, older master materials may reproduce portions of documents that are not fully legible. If you have questions concerning this document or any order you have placed with NTIS, please call our Customer Service Department at (703) 605-6050.

About NTIS

NTIS collects scientific, technical, engineering, and related business information – then organizes, maintains, and disseminates that information in a variety of formats – including electronic download, online access, CD-ROM, magnetic tape, diskette, multimedia, microfiche and paper.

The NTIS collection of nearly 3 million titles includes reports describing research conducted or sponsored by federal agencies and their contractors; statistical and business information; U.S. military publications; multimedia training products; computer software and electronic databases developed by federal agencies; and technical reports prepared by research organizations worldwide.
