Commercial-Scale Demonstration of the Liquid Phase Methanol (LPMEOH TM) Process

Quarterly Report April 1 - June 30, 1997

Work Performed Under Contract No.: DE-FC22-92PC90543

For U.S. Department of Energy Office of Fossil Energy Federal Energy Technology Center Morgantown, West Virginia

By Air Products and Chemicals Inc. Allentown, Pennsylvania

Abstract

The Liquid Phase Methanol (LPMEOH™) Demonstration Project at Kingsport, Tennessee, is a \$213.7 million cooperative agreement between the U.S. Department of Energy (DOE) and Air Products Liquid Phase Conversion Company, L.P. (the Partnership). Air Products and Chemicals, Inc. (Air Products) and Eastman Chemical Company (Eastman) formed the Partnership to execute the Demonstration Project. The LPMEOH™ Process Demonstration Unit was built at a site located at the Eastman complex in Kingsport.

During this quarter, comments from the DOE on the Topical Report "Economic Analysis - LPMEOHTM Process as an Add-on to IGCC for Coproduction" were received. A recommendation to continue with design verification testing for the coproduction of dimethyl ether (DME) and methanol was made. DME design verification testing studies show the liquid phase DME (LPDME) process will have a significant economic advantage for the coproduction of DME for local markets. An LPDME catalyst system with reasonable long-term activity and stability is being developed. A recommendation document summarizing catalyst targets, experimental results, and the corresponding economics for a commercially successful LPDME catalyst was issued on 30 June 1997.

The off-site, product-use test plan was updated in June of 1997. During this quarter, Acurex Environmental Corporation and Air Products screened proposals for this task by the likelihood of the projects to proceed and the timing for the initial methanol requirement. Eight sites from the list have met these criteria. The formal submission of the eight projects for review and concurrence by the DOE will be made during the next reporting period.

The site paving and final painting were completed in May of 1997. Start-up activities were completed during the reporting period, and the initial methanol production from the demonstration unit occurred on 02 April 1997. The first extended stable operation at the nameplate capacity of 80,000 gallons per day (260 tons per day) took place on 06 April 1997.

Pressure drop and resistance coefficient across the gas sparger at the bottom of the reactor increased over this initial operating period. The demonstration unit was shut down from 08 May - 17 June 1997 as part of a scheduled complex outage for the Kingsport site. During this outage, the gas sparger was removed, cleaned, and reinstalled. After completion of other maintenance activities, the demonstration unit was restarted, and maintained stable operation through the remainder of the reporting period. Again, the gas sparger showed an increase in pressure drop and resistance since the restart, although not as rapidly as during the April-May operation. Fresh oil was introduced online for the first time to a new flush connection on the gas inlet line to the reactor; the flush lowered the pressure drop by 1 psi. However, the effects were temporary, and the sparger resistance coefficient continued to increase. Additional flushing with both fresh oil and entrained slurry recovered in the cyclone and secondary oil knock-out drum will be attempted in order to stabilize the sparger resistance coefficient.

Catalyst activity, as defined by the ratio of the rate constant at any point in time to the rate constant for a freshly reduced catalyst (as determined in the laboratory autoclave), declined more rapidly than expected. A catalyst slurry sample was taken during the May/June 1997 complex outage for analysis.

Overall, the LPMEOHTM Demonstration Unit operated well during the initial campaign. The availability of the LPMEOHTM Demonstration Unit was 94.9% during the reporting period. All methanol produced (a total of 2,900,692 gallons) was used by Eastman in the production of methyl acetate, and ultimately cellulose acetate and acetic acid. The start-up was successfully completed in a safe and environmentally sound manner.

Ninety-eight percent (98%) of the \$38 million of funds forecast for the Kingsport portion of the LPMEOHTM Process Demonstration Project for the Phase 1 and Phase 2 tasks have been expended (as invoiced), as of 30 June 1997. Five percent (5%) of the \$158 million of funds for the Phase 3 tasks have been expended (as invoiced), as of 30 June 1997.

ACRONYMS AND DEFINITIONS

Acurex - Acurex Environmental Corporation
Air Products - Air Products and Chemicals, Inc.

AFDU - Alternative Fuels Development Unit - The "LaPorte PDU"

Balanced Gas - A syngas with a composition of hydrogen (H₂), carbon monoxide (CO), and carbon dioxide (CO₂) in stoichiometric balance for the production of methanol

Carbon Monoxide Gas - A syngas containing primarily carbon monoxide (CO); also called CO Gas

Catalyst Age (η -eta) - the ratio of the rate constant at any point in time to the rate constant for a freshly reduced

catalyst (as determined in the laboratory autoclave)

Catalyst Concentration - Synonym for Slurry Concentration
Catalyst Loading - Synonym for Slurry Concentration

CO Conversion - the percentage of CO consumed across the reactor

Crude Grade Methanol - Underflow from rectifier column (29C-20), defined as 80 wt% minimum purity;

requires further distillation in existing Eastman equipment prior to use

DME - dimethyl ether

DOE - United States Department of Energy

DOE-FETC - The DOE's Federal Energy Technology Center (Project Team)

DOE-HQ - The DOE's Headquarters - Coal Fuels and Industrial Systems (Project Team)

DTP - Demonstration Test Plan - The four-year Operating Plan for Phase 3, Task 2 Operation

DVT - Design Verification Testing
Eastman - Eastman Chemical Company

EIV - Environmental Information Volume
EMP - Environmental Monitoring Plan
EPRI - Electric Power Research Institute

Fresh Feed - sum of Balanced Gas, H₂ Gas, and CO Gas

Gas Holdup - the percentage of reactor volume up to the Gassed Slurry Height which is gas

Gassed Slurry

Height - height of gassed slurry in the reactor

HAPs - Hazardous Air Pollutants

Hydrogen Gas - A syngas containing an excess of hydrogen (H₂) over the stoichiometric balance for

the production of methanol; also called H₂ Gas

IGCC - Integrated Gasification Combined Cycle, a type of electric power generation plant
IGCC/OTM - An IGCC plant with a "Once-Thru Methanol" plant (the LPMEOH™ Process) added-on

Inlet Superficial

Velocity - the ratio of the actual cubic feet of gas at the reactor inlet (calculated at the reactor

temperature and pressure) to the reactor cross-sectional area (excluding the area contribution

by the internal heat exchanger); typical units are feet per second

K - Sparger resistance coefficient (term used in calculation of pressure drop)

KSCFH - Thousand Standard Cubic Feet per Hour

LaPorte PDU - The DOE-owned experimental unit (PDU) located adjacent to Air Products' industrial

gas facility at LaPorte, Texas, where the LPMEOH™ process was successfully piloted

LPDME - Liquid Phase DME process, for the production of DME as a mixed coproduct with

methanol

LPMEOHTM - Liquid Phase Methanol (the technology to be demonstrated)

MeOH - methanol

Methanol Productivity - the gram-moles of methanol produced per hour per kilogram catalyst (on an oxide basis)

MTBE - methyl tertiary butyl ether

MW - molecular weight, pound per pound mole
NEPA - National Environmental Policy Act

OSHA - Occupational Safety and Health Administration

ρ - density, pounds per cubic foot

ΔP - pressure drop, psi

Partnership - Air Products Liquid Phase Conversion Company, L.P.

PDU - Process Development Unit

ACRONYMS AND DEFINITIONS (cont'd)

Executive Summary

The Liquid Phase Methanol (LPMEOH™) Demonstration Project at Kingsport, Tennessee, is a \$213.7 million cooperative agreement between the U.S. Department of Energy (DOE) and Air Products Liquid Phase Conversion Company, L.P. (the Partnership). Air Products and Chemicals, Inc. (Air Products) and Eastman Chemical Company (Eastman) formed the Partnership to execute the Demonstration Project. The LPMEOH™ Process Demonstration Unit was designed, constructed, and has begun start-up at a site located at the Eastman complex in Kingsport.

On 04 October 1994, Air Products and Eastman signed the agreements that would form the Partnership, secure the demonstration site, and provide the financial commitment and overall project management for the project. These partnership agreements became effective on 15 March 1995, when DOE authorized the commencement of Budget Period No. 2 (Modification No. A008 to the Cooperative Agreement). The Partnership has subcontracted with Air Products to provide the overall management of the project, and to act as the primary interface with DOE. As subcontractor to the Partnership, Air Products provided the engineering design, procurement, construction, and commissioning of the LPMEOHTM Process Demonstration Unit, and is providing the technical and engineering supervision needed to conduct the operational testing program required as part of the project. As subcontractor to Air Products, Eastman is responsible for operation of the LPMEOHTM Process Demonstration Unit, and for the interconnection and supply of synthesis gas (syngas), utilities, product storage, and other needed services.

The project involves the construction of an 80,000 gallons per day (260 tons per day (TPD)) methanol unit utilizing coal-derived syngas from Eastman's integrated coal gasification facility. The new equipment consists of syngas feed preparation and compression facilities, the liquid phase reactor and auxiliaries, product distillation facilities, and utilities.

The technology to be demonstrated is the product of a cooperative development effort by Air Products and DOE in a program that started in 1981. Developed to enhance electric power generation using integrated gasification combined cycle (IGCC) technology, the LPMEOH™ process is ideally suited for directly processing gases produced by modern day coal gasifiers. Originally tested at a small, DOE-owned experimental unit in LaPorte, Texas, the technology provides several improvements essential for the economic coproduction of methanol and electricity directly from gasified coal. This liquid phase process suspends fine catalyst particles in an inert liquid, forming a slurry. The slurry dissipates the heat of the chemical reaction away from the catalyst surface, protecting the catalyst and allowing the methanol synthesis reaction to proceed at higher rates.

At the Eastman complex, the technology is integrated with existing coal gasifiers. A carefully developed test plan will allow operations at Eastman to simulate electricity demand load-following in coal-based IGCC facilities. The operations will also demonstrate the enhanced stability and heat dissipation of the conversion process, its reliable on/off operation, and its ability to produce methanol as a clean liquid fuel without additional

upgrading. An off-site, product-use test program will be conducted to demonstrate the suitability of the methanol product as a transportation fuel and as a fuel for stationary applications for small modular electric power generators for distributed power.

The four-year operating test phase will demonstrate the commercial application of the LPMEOH™ process to allow utilities to manufacture and sell two products: electricity and methanol. A typical commercial-scale IGCC coproduction facility, for example, could be expected to generate 200 to 350 MW of electricity, and to also manufacture 45,000 to 300,000 gallons per day of methanol (150 to 1,000 TPD). A successful demonstration at Kingsport will show the ability of a local resource (coal) to be converted in a reliable (storable) and environmentally preferable way to provide the clean energy needs of local communities for electric power and transportation.

This project may also demonstrate the production of dimethyl ether (DME) as a mixed coproduct with methanol if laboratory- and pilot-scale research and market verification studies show promising results. If implemented, the DME would be produced during the last six months of the four-year demonstration period. DME has several commercial uses. In a storable blend with methanol, the mixture can be used as a peaking fuel in gasification-based electric power generating facilities, or as a diesel engine fuel. Blends of methanol and DME can be used as chemical feedstocks for synthesizing chemicals, including new oxygenated fuel additives.

The project was reinitiated in October of 1993, when DOE approved a site change to the Kingsport location. DOE conditionally approved the Continuation Application to Budget Period No. 2 (Design and Construction) in March of 1995 and formally approved it on 01 June 1995 (Mod M009). After approval, the project initiated Phase 1 - Design - activities. Phase 2 - Construction - activities were initiated in October of 1995. The project required review under the National Environmental Policy Act (NEPA) to move to the construction phase. DOE prepared an Environmental Assessment (DOE/EA-1029), and subsequently a Finding of No Significant Impact (FONSI) was issued on 30 June 1995. The Cooperative Agreement was modified (Modification No. A011) on 08 October 1996, authorizing the transition from Budget Period No. 2 (Design and Construction) to the final Budget Period (Commissioning, Start-up, and Operation). This modification provides the full \$213,700,000 of authorized funding, with 56.7% participant cost share and 43.3% DOE cost share.

During this quarter, comments from the DOE on the Topical Report "Economic Analysis - LPMEOH™ Process as an Add-on to IGCC for Coproduction" were received. The study concludes that methanol coproduction, with IGCC electric power utilizing the LPMEOH™ process technology, will be competitive in serving local market needs.

A recommendation to continue with DME design verification testing was made. DME design verification testing studies show the liquid phase DME (LPDME) process will have a significant economic advantage for the coproduction of DME for local markets. The market applications for DME are large. An LPDME catalyst system with reasonable long-term activity and stability is being developed. Planning for a proof-of-concept test run at the

Alternative Fuels Development Unit (AFDU) in LaPorte, TX was recommended. A recommendation document summarizing catalyst targets, experimental results, and the corresponding economics for a commercially successful LPDME catalyst was issued on 30 June 1997.

The off-site, product-use test plan was updated in June of 1997. During this quarter, Acurex Environmental Corporation (Acurex) and Air Products screened proposals for this task by the likelihood of the projects to proceed and the timing for the initial methanol requirement. Eight sites from the list have met these criteria. The formal submission of the eight projects for review and concurrence by the DOE will be made during the next reporting period.

An interim project review meeting was held in Allentown in late April of 1997. An update on the performance of the demonstration unit was provided, and the status of the DME recommendation and the off-site, product-use test plan were discussed.

The site paving and final painting were completed in May of 1997. Start-up activities were completed during the reporting period, and the initial methanol production from the demonstration unit occurred on 02 April 1997. The first extended stable operation at the nameplate capacity of 80,000 gallons per day (260 TPD) took place on 06 April 1997. Pressure drop and resistance coefficient across the gas sparger at the bottom of the reactor increased over this initial operating period. The demonstration unit was shut down on 08 May 1997 as part of a scheduled complex outage for the Kingsport site. During this outage, the gas sparger was removed, cleaned, and reinstalled. After completion of other maintenance activities, the demonstration unit was restarted on 17 June 1997, and maintained stable operation through the remainder of the reporting period. Again, the gas sparger showed an increase in pressure drop and resistance since the restart, although not as rapidly as during the April/May operation. Fresh oil was introduced online for the first time to a new flush connection on the gas inlet line to the reactor; the flush lowered the pressure drop by 1 psi. However, the effects were temporary, and the sparger resistance coefficient continued to increase. Additional flushing with both fresh oil and entrained slurry recovered in the cyclone and secondary oil knock-out drum will be attempted in order to stabilize the sparger resistance coefficient.

Catalyst activity, as defined by the ratio of the rate constant at any point in time to the rate constant for a freshly reduced catalyst (as determined in the laboratory autoclave), declined more rapidly than expected. A catalyst slurry sample was taken during the May/June 1997 complex outage for analysis.

Overall, the LPMEOHTM Demonstration Unit operated well during the initial campaign. The availability of the LPMEOHTM Demonstration Unit was 94.9% during the reporting period. All methanol produced (a total of 2,900,692 gallons) was used by Eastman in the production of methyl acetate, and ultimately cellulose acetate and acetic acid. The start-up was successfully completed in a safe and environmentally sound manner.

Ninety-eight percent (98%) of the \$38 million of funds forecast for the Kingsport portion of the LPMEOHTM Process Demonstration Project for the Phase 1 and Phase 2 tasks have been

expended (as invoiced), as of 30 June 1997. Five percent (5%) of the \$158 million of funds for the Phase 3 tasks have been expended (as invoiced), as of 30 June 1997.

A. Introduction

The Liquid Phase Methanol (LPMEOH™) demonstration project at Kingsport, Tennessee, is a \$213.7 million cooperative agreement between the U.S. Department of Energy (DOE) and Air Products Liquid Phase Conversion Company, L. P. (the Partnership). Air Products and Chemicals, Inc. (Air Products) and Eastman Chemical Company (Eastman) formed the Partnership to execute the Demonstration Project. A demonstration unit producing 80,000 gallons per day (260 TPD) of methanol was designed, constructed, and has begun operation at a site located at the Eastman complex in Kingsport. The Partnership will own and operate the facility for the four-year demonstration period.

This project is sponsored under the DOE's Clean Coal Technology Program, and its primary objective is to "demonstrate the production of methanol using the LPMEOHTM Process in conjunction with an integrated coal gasification facility." The project will also demonstrate the suitability of the methanol produced for use as a chemical feedstock or as a low-sulfur dioxide, low-nitrogen oxides alternative fuel in stationary and transportation applications. The project may also demonstrate the production of dimethyl ether (DME) as a mixed coproduct with methanol, if laboratory- and pilot-scale research and market verification studies show promising results. If implemented, the DME would be produced during the last six months of the four-year demonstration period.

The LPMEOH[™] process is the product of a cooperative development effort by Air Products and the DOE in a program that started in 1981. It was successfully piloted at a 10-TPD rate in the DOE-owned experimental unit at Air Products' LaPorte, Texas, site. This demonstration project is the culmination of that extensive cooperative development effort.

B. Project Description

The demonstration unit, which occupies an area of 0.6 acre, is integrated into the existing 4,000-acre Eastman complex located in Kingsport, Tennessee. The Eastman complex employs approximately 12,000 people. In 1983, Eastman constructed a coal gasification facility utilizing Texaco technology. The synthesis gas (syngas) generated by this gasification facility is used to produce carbon monoxide and methanol. Both of these products are used to produce methyl acetate and ultimately cellulose acetate and acetic acid. The availability of this highly reliable coal gasification facility was the major factor in selecting this location for the LPMEOHTM Process Demonstration. Three different feed gas streams (hydrogen gas, carbon monoxide gas, and balanced gas) will be diverted from existing operations to the LPMEOHTM demonstration unit, thus providing the range of coalderived syngas ratios (hydrogen to carbon monoxide) needed to meet the technical objectives of the demonstration project.

For descriptive purposes and for design and construction scheduling, the project has been divided into four major process areas with their associated equipment:

- Reaction Area Syngas preparation and methanol synthesis reaction equipment.
- Purification Area Product separation and purification equipment.
- Catalyst Preparation Area Catalyst and slurry preparation and disposal equipment.
- Storage/Utility Area Methanol product, slurry, and oil storage equipment.

The physical appearance of this facility closely resembles the adjacent Eastman process plants, including process equipment in steel structures.

• Reaction Area

The reaction area includes feed gas compressors, catalyst guard beds, the reactor, a steam drum, separators, heat exchangers, and pumps. The equipment is supported by a matrix of structural steel. The most salient feature is the reactor, since with supports, it is approximately 84-feet tall.

• Purification Area

The purification area features two distillation columns with supports; one is approximately 82-feet tall, and the other 97-feet tall. These vessels resemble the columns of the surrounding process areas. In addition to the columns, this area includes the associated reboilers, condensers, air coolers, separators, and pumps.

• Catalyst Preparation Area

The catalyst preparation area consists of a building with a roof and partial walls, in which the catalyst preparation vessels, slurry handling equipment, and spent slurry disposal equipment are housed. In addition, a hot oil utility system is included in the area.

• Storage/Utility Area

The storage/utility area includes two diked lot-tanks for methanol, two tanks for oil storage, a slurry holdup tank, a trailer loading/unloading area, and an underground oil/water separator. A vent stack for safety relief devices is located in this area.

C. Process Description

The LPMEOHTM demonstration unit is integrated with Eastman's coal gasification facility. A simplified process flow diagram is included in Appendix A. Syngas is introduced into the slurry reactor, which contains a slurry of liquid mineral oil with suspended solid particles of catalyst. The syngas dissolves through the mineral oil, contacts the catalyst, and reacts to form methanol. The heat of reaction is absorbed by the slurry and is removed from the slurry by steam coils. The methanol vapor leaves the reactor, is condensed to a liquid, sent to the distillation columns for removal of higher alcohols, water, and other impurities, and is

then stored in the day tanks for sampling before being sent to Eastman's methanol storage. Most of the unreacted syngas is recycled back to the reactor with the syngas recycle compressor, improving cycle efficiency. The methanol will be used for downstream feedstocks and in off-site, product-use testing to determine its suitability as a transportation fuel and as a fuel for stationary applications in the power industry.

D. Results and Discussion

The project status is reported by task, and then by the goals established by the Project Evaluation Plan for Budget Period No. 2 (see Appendix B). Major accomplishments during this period are as follows:

Task 1.2 Permitting

For this task the Project Evaluation Plan for Budget Period No. 2 establishes these goals:

- Issue the Final Environmental Information Volume (EIV) to support the DOE's Environmental Assessment/Finding of No Significant Impact.
 - The NEPA review was completed 30 June 1995 with the issuance of an Environmental Assessment (DOE/EA-1029) and Finding of No Significant Impact (FONSI). The Final Environmental Information Volume was approved by the DOE on 29 August 1996. Copies of the Final EIV were distributed in September of 1996.
- Obtain permits necessary for construction and operation.
 - The construction and operation permits have been obtained.

Task 1.3 Design Engineering

For this task the Project Evaluation Plan for Budget Period No. 2 establishes these goals:

- Prepare the Environmental Monitoring Plan (EMP).
 - The DOE approved the Draft Final EMP on 29 August 1996. Copies of the Final EMP were distributed in September of 1996.
- Complete the design engineering necessary for construction and commissioning. This includes Piping and Instrumentation Diagrams, Design Hazard Reviews, and the conduct of design reviews.
 - Task 1.3 Design Engineering is complete.

Task 1.4 Off-Site Testing (Definition and Design)

The Project Evaluation Plan for Budget Period No. 2 establishes the following goal for this task:

• Prepare the product-use demonstration plan for Phase 3, Task 4 Off-Site Product-Use Demonstration. This off-site test plan will be incorporated into an updated, overall (fuel and chemical) product-use test plan (in Phase 1, Task 5).

Discussion

The product-use test plan, developed in 1992 to support the demonstration at the original Cool Water Gasification Facility site, has become outdated. Since the site change to Eastman, the original product test plan under-represents new utility dispersed electric power developments, and possibly new mobile transport engine developments. The updated product-use test plan will attempt for broader market applications and for commercial fuels comparisons. The objective of the product-use test plan update will be to demonstrate commercial market applications for the "as produced" methanol as a replacement fuel and as a fuel supplement. Fuel economics will be evaluated for the "as produced" methanol for use in municipal, industrial, and utility applications and as fuel supplements for gasoline, diesel, and natural gas. These fuel evaluations will be based on the U.S. energy market needs projected during the 1998 to 2018 time period when the LPMEOH™ technology is expected to be commercialized.

The product-use test plan will be developed to enhance the early commercial acceptance of central clean coal technology processing facilities, coproducing electricity and methanol to meet the needs of the local community. One of the advantages of the LPMEOH™ process for coproduction from coal-derived syngas is that the as-produced, stabilized (degassed) methanol product is of unusually high quality (e.g. less than 1 wt. % water) which may be suitable for the premium fuel applications. Cost savings (10 to 15%) of several cents per gallon of methanol can be achieved, if the suitability of the stabilized product as a fuel can be demonstrated. The applications: as a hydrogen source for fuel cells, and as a clean transportable, storable fuel for dispersed power, will require testing of the product to confirm its suitability.

A limited quantity (up to 400,000 gallons) of the methanol product as produced from the demonstration unit will be made available for product-use tests. Product-use tests will be targeted for an approximate 18 to 30-month period, commencing in the first year of demonstration operations. The methanol product will generally be available for shipment from the demonstration unit in Kingsport, Tennessee; methanol for some of-site tests may be shipped from the inventory held at the Alternative Fuels Development Unit in LaPorte, TX. Air Products, Acurex Environmental Corporation (Acurex), and the DOE will develop the final off-site, product-use test plan.

Activity during this quarter

Acurex and Air Products have been working to identify a variety of sites and applications for product-use tests. During the 29-30 April 1997 interim review meeting, Air Products presented a status update on these activities to the DOE. A total of 22 projects have been screened by their likelihood to proceed and the timing for the initial methanol requirement. Eight sites from the list have met these criteria. Appendix C contains a synopsis of all projects screened, and a table summarizing the best eight candidates. At present, full proposals and cost breakdowns are being developed by Acurex and each of the eight possible participants. Due to the timing and quantities of methanol required by the earliest four tests, Air Products and DOE are considering the use of methanol produced from carbon monoxide (CO)-rich syngas feeds from the LaPorte Alternative Fuels Development Unit (AFDU). This will allow for some initial testing to occur during calendar year 1997, when some of these projects will be ready to proceed. The Demonstration Test Plan indicates methanol for the remaining four tests (asproduced from CO-rich syngas) will first be produced in May of 1998. The formal submission of the eight projects for review and approval by the DOE will be made during the next reporting period.

Task 1.5 Planning and Administration

Task 1.5.1 Product-Use Test Plan

The Project Evaluation Plan for Budget Period No. 2 establishes the following goal for this task:

- Update the (fuel and chemical) product-use test plan to better meet the technical objectives of the project and serve the needs of commercial markets.
 - Air Products and Eastman have updated plans for the on-site product-use demonstrations. The schedule for on-site product-use tests was established for August to October of 1997. Methanol product from the LPMEOH™ Process Demonstration Unit will be used as a chemical feedstock. Eastman will perform fitness-for-use tests on the methanol product for use as a chemical feedstock and provide a summary of the results.

Task 1.5.2 Commercialization Studies

The Project Evaluation Plan for Budget Period No. 2 establishes the following goal for this task:

• Complete economic studies of important commercial aspects of the LPMEOH™ process to enhance IGCC electric power generation. These studies will be used to

provide input to the LPMEOH™ Process Demonstration Unit's Demonstration Test Plan (Phase 2, Task 3).

Discussion

Several areas have been identified as needing development to support specific commercial design studies. These include: a) product purification options; b) front-end impurity removal options; c) catalyst addition/withdrawal options; and d) plant design configuration options. Plant sizes in the range of 300 TPD to 1,800 TPD and plant design configurations for the range from 20% up to 70% syngas conversion will be considered. The Kingsport demonstration unit design and costs will be the basis for value engineering work to focus on specific cost reduction targets in developing the initial commercial plant designs.

The Process Economics Study - Outline has been prepared to provide guidance for the overall study work. The four part Outline is included in Appendix D. This Outline addresses several needs for this Task 1.5.2 Commercialization Study:

- a) to provide process design guidance for commercial plant designs.
- b) to meet the Cooperative Agreement's technical objectives requirement for comparison with gas phase methanol technology. This preliminary assessment will help set demonstration operating goals, and identify the important market opportunities for the liquid phase technology.
- c) to provide input to the Demonstration Test Plan (Task 2.3).
- d) to provide input to the Off-Site Testing (Task 1.4) product-use test plan update.

Activities during this quarter

- Part One of the Outline "Coproduction of Methanol" has been written for release as a Topical Report. Comments from DOE on the 31 March 1997 draft of the Topical Report "Economic Analysis LPMEOH™ Process as an Add-on to IGCC for Coproduction" were received during the reporting period. This Topical Report develops plant design options for the LPMEOH™ process, as an add-on to IGCC power plants for the coproduction of methanol and power. Part One also compares the LPMEOH™ (LP) process with gas phase (GP) methanol processes in the environment of coal-derived syngas. Surprisingly, the LP technology can coproduce methanol at less than 50 cents per gallon, even at relatively small (400 to 1200 TPD) methanol plant sizes. LP's advantage over GP is 6 to 9 cents per gallon. Therefore, when baseload IGCC power is viable, the LP technology makes coproduction viable. An update of this draft Topical Report is expected to be released for comment in September of 1997.
- Part Two of the Outline "Baseload Power and Methanol Coproduction", has been incorporated into the paper, "Fuel and Power Coproduction", that was presented at the DOE's Fifth Annual Clean Coal Technology Conference in January of 1997.

- Part Four of the Outline - "Methanol Fuel Applications", is being used as the basis to update the product-use test plan (Task 1.4).

Task 1.5.3 DME Design Verification Testing

The Project Evaluation Plan for Budget Period No. 2 establishes the following goal for this task:

• Perform initial Design Verification Testing (DVT) for the production of dimethyl ether (DME) as a mixed coproduct with methanol. This activity includes laboratory R&D and market economic studies.

Discussion

The first decision milestone, on whether to continue with DME DVT, was targeted for 01 December 1996. This milestone was relaxed to July of 1997 to allow time for further development of the LPDME catalyst system. DVT is required to provide additional data for engineering design and demonstration decision-making. The essential steps required for decision-making are: a) confirm catalyst activity and stability in the laboratory, b) develop engineering data in the laboratory, and c) confirm market(s), including fuels and chemical feedstocks. The DME Milestone Plan, showing the DVT work and the decision and implementation timing, is included in Appendix E.

Action during this quarter included a recommendation to continue with DME DVT, Market Economic Studies, and Laboratory R&D.

DME DVT Recommendation

Air Products made a recommendation to continue with the design verification testing to coproduce DME with methanol, and to proceed with planning a proof-of-concept test run at the DOE's AFDU in LaPorte, Texas. A copy of the recommendation (dated 30 June 1997) is included in Appendix E. The recommendation was based on the results of the Market Economic Studies and on the LPDME catalyst system R&D work, and is summarized in the following.

The Market Economic Studies show that the LPDME process should have a significant economic advantage for the coproduction of DME with methanol for local markets. The studies show that the market applications for DME are large. DME is an ultra clean diesel fuel; and an 80% DME mixture with methanol and water is now being developed and tested by others. DME is a key intermediate in a commercial syngas-to-gasoline process, and is being developed as an intermediate for other chemicals and fuels. An LPDME catalyst system with reasonable long-term activity and stability has been developed from the Laboratory R&D work. The markets and this catalyst system is sufficiently promising that proof-of-concept planning for the LaPorte AFDU is recommended. A summary of the DME DVT recommendation is:

- Planning for a DME test run at the LaPorte AFDU, in conjunction with other DOE Liquid Fuels Programs, should be initiated. Test plans, budgets, and a schedule for these LaPorte AFDU tests should now be developed. Up to \$875,000 of Clean Coal Technology Program budget support from the LPMEOH™ Project budget could be made available to support a suitable LPDME test run at LaPorte.
- An implementation decision, made mutually by the DOE's Clean Coal Technology Program (DE-FC22-92PC90543) LPMEOH™ project participants, and by the DOE's Indirect Liquefaction Program (DE-FC22-95PC93052) project participants, should be made in time to implement testing at LaPorte.

The recommendation to continue design verification testing to coproduce DME with methanol at the LaPorte AFDU is now under consideration. LPDME is not applicable to hydrogen (H₂)-rich syngas; and it is unlikely that a substantive LPDME demonstration will be recommended for Kingsport. Therefore, a convincing case that the test-run on CO-rich syngas at LaPorte will lead to successful commercialization must be made, prior to approving the final test-run plan. The strategy for commercialization must present the technical logic to combine the results of the following two areas:

- catalyst performance (productivity, selectivity, and life) for the LPDME catalyst system under CO-rich syngas from the proof-of-concept testing at the LaPorte AFDU; and
- 2) reactor performance (methanol catalyst activity and life, hydrodynamics, and heat transfer) from the LPMEOH™ Process Demonstration Unit

The productivity and life of an "acceptable" LPDME catalyst system must be better defined, and then confirmed in the laboratory. A recommendation document summarizing catalyst targets, experimental results, and the corresponding economics for a commercially successful LPDME catalyst was issued on 30 June 1997.

Market Economic Studies

Work on the feasibility study for the coproduction of DME and methanol with electric power continued. The product DME would be used as a domestic liquid cooking fuel, to replace imported Liquid Petroleum Gas, for the China and Pacific Rim regions. The results to date, are included in the DME recommendation in Appendix E.

Laboratory R&D

Initially, synthesis of DME concurrently with methanol in the same reactor was viewed as a way of overcoming the syngas conversion limitations imposed by equilibrium in the LPMEOH™ process. Higher syngas conversion would provide improved design flexibility for the coproduction of power and liquid fuels from an IGCC facility. The liquid phase DME (LPDME) process concept seemed ideally suited for the slurry-based liquid phase

technology, since the second reaction (methanol to DME) could be accomplished by adding a second catalyst with dehydration activity to the methanol-producing reactor. Initial research work determined that two catalysts, a methanol catalyst and an alumina-based dehydration catalyst, could be physically mixed in different proportions to control the yield of DME and of methanol in the mixed product. Previously, proof-of-concept runs, in the laboratory and at the Alternative Fuels Development Unit (AFDU), confirmed that a higher syngas conversion could be obtained when a mixture of DME and methanol is produced in the liquid phase reactor.

Subsequent catalyst activity-maintenance experiments have shown the catalyst system utilized in the proof-of-concept runs experienced relatively fast deactivation compared to the LPMEOHTM process catalyst system. Further studies of the LPDME catalyst deactivation phenomenon, initially undertaken under the DOE's Liquid Fuels Program (Contract No. DE-FC22-95PC93052), was continued under this Task 1.5.3 through Fiscal Year 1996, and is now again being continued under the DOE Liquid Fuels Program. This LPDME catalyst deactivation research has determined that an interaction between the methanol catalyst and the dehydration catalyst is the cause of the loss of activity. Parallel research efforts--a) to determine the nature of the interaction; and b) to test new dehydration catalysts--was undertaken. In late 1995, the stability of the LPDME catalyst system was greatly improved, to near that of an LPMEOHTM catalyst system, when a new aluminum-based (AB) dehydration catalyst was developed. This new AB catalyst development showed that modification of the LPDME catalyst system could lead to long life. During this quarter, laboratory work continued on developing an LPDME catalyst system based on the AB series of catalysts.

Summary of Laboratory Activity and Results

- Experiments using an alternative methanol catalyst with the AB dehydration catalyst have given the highest productivity seen for a stable catalyst system. A new reduction procedure, one which reflects plant procedure, was also used. No sign of the accelerated long-term catalyst deactivation was observed following 1030 stream hours of testing.
- This new reduction procedure has given good stability in a run at low feed rates on a syngas typically produced by a Shell coal gasifier. This run is part of a matrix of experiments to understand the effects of space velocity and feed gas composition on catalyst stability.
- Air Products has begun discussing scale-up of the production of the AB dehydration catalyst with two catalyst manufacturers. The key technical issue at this point is whether nitridation is (a) commercially feasible and (b) technically desirable in light of recent laboratory successes in improving the stability of non-nitrided material.

Task 1.5.4 Administration and Reporting

The Cooperative Agreement was modified (Modification No. A011 on 08 October 1996), authorizing the transition from Budget Period No. 2 (Design and Construction) to the final Budget Period (Commissioning, Start-up, and Operation). This modification provides the

full DOE cost share of \$92,700,000 of authorized funding, with the remaining \$121,000,000 being provided by the participants. A copy of the approval memorandum, dated 03 October 1996, is included in Appendix F.

The remainder of the DOE reporting tasks are being performed and reported under Task 3.6 (Planning and Administration).

Task 2.1 Procurement

The Project Evaluation Plan for Budget Period No. 2 establishes the following goal for this task:

- Complete the bidding and procurement for all equipment and Air Products-supplied construction materials.
 - Task 2.1 Procurement is complete.

Task 2.2 Construction

The Project Evaluation Plan for Budget Period No. 2 establishes the following goal for this task:

- Provide construction management for contractor coordination and compliance with design, construction, and quality control standards.
- Erect the major equipment and structural steel. Install the large bore piping, electrical, and insulation such that instrument check-out and equipment commissioning work can be completed during the 60-day Continuation Application approval period.
- Complete mechanical construction so that check-out and commissioning can be started in Budget Period No. 3.
 - All major construction contract work has been completed. During the reporting period, site paving/grading and the painting of large- and some small-bore piping systems was completed in May of 1997.

Task 2.3 Training and Commissioning

The Project Evaluation Plan for Budget Period No. 2 establishes the following goals for this task:

• Prepare a four-year test plan for Phase 3, Task 2 - Operation.

- The four-year Demonstration Test Plan (DTP) was approved and issued in September of 1996.
- Prepare the operating manual and initiate the operator training program.
 - The operator training was completed in December of 1996. Final additions to the operating manual were made in January of 1997.
 - Task 2.3 Training and Commissioning is complete.

Task 2.4 Off-Site Testing (Procurement and Construction)

The Project Evaluation Plan for Budget Period No. 2 establishes the following goal for this task:

- Prepare the final off-site, product-use test plan.
 - The off-site, product-use test plan update is being reported under the Task 1.4 Off-Site Testing (Definition and Design).

Task 2.5 Planning and Administration

The Project Evaluation Plan for Budget Period No. 2 establishes the following goals for this task:

- Prepare annually an updated (Partnership) plan for the remaining activities. The first annual plan will update the remaining Phase 1 and Phase 2 activities, and the second will include an update of the Phase 3 Demonstration Test Plan.
 - The first update of the Partnership Annual Operating Plan was prepared and submitted in September of 1995 (See Quarterly Technical Progress Report No. 5). The main goal and objective for this first annual plan was to continue construction so that the LPMEOH™ demonstration unit would be ready for commissioning and start-up in 1996; and to complete the Project Evaluation Report and to submit it to the DOE along with the Continuation Application for Budget Period No. 3.
 - The second update of the Partnership Annual Operating Plan was prepared and submitted in November of 1996 (see Appendix G). The main goal and objective for this second annual plan is to initiate Phase 3 Operation of the LPMEOHTM demonstration unit and to achieve 30 weeks of operation (Task 2.1.1 Operation) by September of 1997 in accordance with the Demonstration Test Plan. Other objectives include continuation of DME design verification testing, and updating the plan for off-site product-use testing.
- Submit all Project status, milestone schedule, and cost management reports as required by the Cooperative Agreement.

- The DOE reporting tasks are being performed and reported under Task 3.6 (Planning and Administration).

Task 3.1 Start-up

Start-up activities were completed on 02 April 1997 with the initial production of methanol.

Task 3.2 LPMEOH™ Process Demonstration Facility Operation

Task 3.2.1 Methanol Operation

Upon completion of the activation of the nine batches of methanol synthesis catalyst (reported in Technical Progress Report No. 11), the catalyst slurry was transferred from the 29D-02 slurry storage tank to the 29C-01 reactor (refer to Appendix A for the simplified process flow diagram). A portion of the slurry was pumped by the 29G-02 slurry return pump; the remainder was pressure-transferred using nitrogen at 45-50 psig on the slurry storage tank. Heat-up of the catalyst slurry by injecting 600 psig steam into the risers of the internal heat exchanger on the reactor proceeded smoothly. Balanced Gas was introduced to the LPMEOHTM demonstration unit at 0900 hours on 02 April 1997, but several coincidental interruptions in feed gas supply delayed extended, stable operation for several more days. The first stable operation at the nameplate methanol capacity of 80,000 gallons per day (260 TPD) was achieved on 06 April 1997. The Test Authorization for the initial operating campaign at the LPMEOHTM demonstration unit is provided in Appendix H.

The summary table of performance data over the entire reporting period for the LPMEOHTM demonstration unit is included in Table 3.2.1-1. These data represent daily averages, typically from a 24-hour material balance period; those days with less than 12 hours of stable operation are omitted from this table. Appendix J contains samples of the detailed material balance report which are representative of the operation of the LPMEOHTM demonstration unit during the reporting period.

Appendix I, Table 1 contains the summary of outages for the LPMEOH™ demonstration unit. This table also calculates the availability of the LPMEOH™ demonstration unit over the reporting period.

The following discussion of performance results will focus on the distinct operating periods during the quarter and detailed reporting of specific performance parameters.

Initial Operating Period - 02 April - 08 May 1997

The frequent feed gas interruptions continued for several more days, so that the first stable 24-hour material balance period occurred on 12 April 1997. The highest methanol production rate over a 24-hour period occurred on 19 April 1997 (89,900 gallons per day, or

292.2 TPD); for shorter balance periods (approximately 12 hours), methanol production rates of 92,900 to 94,500 gallons per day (302 to 307 TPD) were measured.

During the first days of operation, several strainers in the reactor loop became blocked with debris remaining in the piping systems from construction and hydrotesting. Outages were taken to clean screens at the inlet to the 29C-40 carbonyl guard bed and the 29C-03 high-pressure methanol separator. The carbonyl guard bed was bypassed from 04 April 1997 until 18 April 1997; the decision to bypass the carbonyl guard bed was based upon the results of the carbonyl survey completed in March (as reported in Technical Progress Report No. 11) and an autoclave test performed at the Kingsport site in May/June 1996. A draft Topical Report has been issued on that study (Design and Construction of the Alternative Fuels Field Test Unit and Liquid Phase Methanol Feedstock and Catalyst Life Testing at Eastman Chemical Company (Kingsport, TN)).

As noted in Technical Progress Report No. 11, the 29G-03 oil make-up pumps were unable to deliver fresh oil to the reactor loop at the required pressure of approximately 700 psig. These pumps also provide the required high pressure seal flush to the 29G-01 condensed oil circulation pumps, which return oil and catalyst collected in the 29C-06 cyclone and the 29C-05 secondary oil knock-out drum to the reactor (refer to Appendix A for the simplified process flow diagram). One of the features included in the design of the LPMEOHTM Demonstration Unit was the capability to free-drain condensed and entrained oil and catalyst slurry back to the reactor. Furthermore, fresh make-up oil could be added to the process by using the 29G-30 slurry transfer pump, which was designed to transfer catalyst slurry from the 29C-30 catalyst reduction vessel to the reactor. Oil was batch-transferred from the 29D-30 oil storage tank to the catalyst reduction vessel, and then pumped to the reactor by the slurry transfer pump. The slurry transfer pump has packing which also requires flush from the oil make-up pumps; however, it was determined that operation of the slurry transfer pump in services with clean oil or low solids concentration would not adversely affect the service life of the pump.

The free-drain line showed intermittent plugging or vapor-locking during operation. Early in the operating campaign, blockages could be cleared by opening a transfer line between the secondary oil knock-out drum and catalyst reduction vessel and briefly blowing down to low pressure; piping connections to provide flush oil were rendered useless by the inoperable oil make-up pumps. However, on 25 April 1997, a blockage in the free-drain line occurred in a location which could not be removed by this method. Since the slurry concentration of the entrained oil and catalyst was relatively low, it was determined that the slurry transfer pump could pump this material without packing flush on the pump. Condensed oil was batch-transferred from the secondary oil knock-out drum to the catalyst reduction vessel, and then pumped to the reactor. The frequency of the transfer to the catalyst reduction vessel was about every 3 hours, and the catalyst reduction vessel was pumped to the reactor about every 10 hours. The rate of accumulation of entrained/condensed slurry (1.5 to 2.0 gallons per minute) matched the expected liquid traffic within the oil/catalyst collection equipment.

A two-day test using a CO-rich reactor feed ($H_2/CO = 0.43$) was performed on 07-08 May 1997. The Test Authorization for this trial is included in Appendix K. At the conclusion of

this test, the LPMEOH™ Demonstration Unit was shut down in preparation for a biannual outage at the Eastman coal-to-chemicals facility. Catalyst slurry was pressure-transferred from the reactor to the slurry storage tank for storage under a reducing atmosphere during the outage.

Throughout this initial operating period, pressure-drop measurements across the gas sparger at the bottom of the reactor showed a steady increase during normal operation. Pressure drop can be expressed in the following equation:

$$\Delta P = \underline{K * (V * MW)^2}$$

where:

 ΔP = pressure drop across sparger, pounds per square inch

K = sparger resistance coefficient

V = vapor volumetric flowrate, thousand standard cubic feet per hour

MW = vapor molecular weight, pounds per pound mole

 ρ = vapor density, pounds per cubic foot

This equation shows that pressure drop readings can be influenced by changes in gas flowrate and/or gas composition. The resistance coefficient (K) can be used to determine any change in the vapor flow path through the gas sparger. For a given vapor volumetric flowrate and density, an increase in K (caused by a restriction in the flow path, for example), will result in an increase in pressure drop.

Appendix I, Figure 1 plots K over time since the start-up of the LPMEOHTM Demonstration Unit. (Note that K as reported contains an arbitrary factor to make the value more manageable, and therefore has meaning only in a relative sense.) The data for this plot, along with the corresponding pressure drop measurement, are included in Table 3.2.1-1. Pressure drop and resistance increased with time on stream, and extended periods with no vapor flow through the gas sparger (noted on Figure 1) appear to have no impact on this trend.

Maintenance Activities During May/June 1997 Complex Outage

Most of the activities in the LPMEOH™ Demonstration Unit during the complex outage focused on the inspection of equipment associated with the reactor, particularly the gas sparger. About 800 pounds of residual catalyst was removed from the bottom head of the reactor during this exercise. A solid material (presumably methanol synthesis catalyst) appeared to block about 50% of the flow path through the sparger; a small amount of catalyst was found in the inlet piping to the sparger. There was no discernible pattern to the blockage by the catalyst, and no significant construction debris was found in the inlet piping or in the sparger. The sparger was removed from the reactor and cleaned. The only modifications to the sparger itself were changes to increase the maximum allowable pressure drop; no change to the flow distribution characteristics was made.

Another effect of the commissioning problems associated with the oil make-up pumps is the loss of oil flush provided by the condensed oil circulation pumps to the walls of the cyclone. At the LaPorte AFDU, liquid flush to the cyclone improved the efficiency of solids removal. During the complex outage, the inlet to the tubesheet of the 29E-02 feed/product heat exchanger (immediately downstream of the cyclone) was removed to check for catalyst accumulation. The tubesheet was generally clean except for a small, off-center accumulation on the upper left quadrant. The catalyst slightly obstructed the entrance to these tubes, but did not completely block any tube. No catalyst was visible within any of the tubes. The surface catalyst was removed, and the feed/product heat exchanger was reassembled.

During the initial operating period, the blockage in the free-drain line provided evidence that the ability to flush piping systems in slurry service was an important operability requirement. Since a replacement for the oil make-up pumps had not yet been identified, the slurry transfer pump was connected into the flush piping system originally designed to be supplied by the oil make-up pumps. A flush connection was also added to the gas inlet line to the reactor; this could be used to flush out the piping and gas sparger during normal operation, at those times when gas flow to the reactor is lost, or in preparation for maintenance.

Other maintenance activities focused on repair of minor leaks in the steam system.

Unit Restart and Operation - 17-30 June 1997

After the catalyst slurry was pressure-transferred from the slurry storage tank to the reactor, the reactor was heated using 600 psig steam in the same manner as the April start-up. Balanced Gas was introduced to the LPMEOH™ Demonstration Unit at 1400 hours on 17 June 1997. Operation of the facility has continued uninterrupted since the restart. The free-drain piping from the secondary oil knock-out drum and cyclone to the reactor plugged again shortly after restart, but flush oil from the slurry transfer pump successfully dislodged the blockage.

Again, the gas sparger has shown an increase in pressure drop and resistance since the restart, although not as rapidly as during the April-May operation. The plot of sparger resistance coefficient with time for both operating periods is provided in Appendix I, Figure 1. The value for the resistance coefficient is lower for the latest start-up of the reactor; this may be a result of additional attention to maintaining vapor flow through the sparger during the slurry transfer operation. On 26 June 1997, fresh oil from the slurry transfer pump was introduced for the first time to the new flush connection on the gas inlet line to the reactor; the flush lowered the pressure drop from 5.5 psi to 4.5 psi. However, the effects were temporary, and the resistance coefficient continued to increase. Additional flushing with both fresh oil and entrained slurry will be attempted in order to stabilize the resistance coefficient. Fresh oil can only be added to the process at an average of 0.1 - 0.2 gallons per minute to match the rate of oil loss with the methanol product; entrained slurry can be supplied at the rate of liquid traffic in the secondary oil knock-out drum and cyclone (1.5 to 2.0 gallons per minute).

Catalyst Life (eta)

The activity of the methanol synthesis catalyst can be expressed in terms of a dimensionless variable eta (η) , which is defined as the ratio of the rate constant at any point in time to the rate constant for a freshly reduced catalyst (as determined in the laboratory autoclave). Appendix I, Figure 2 contains the plot for η versus days onstream since the start-up in April of 1997; shutdowns of the LPMEOHTM Demonstration Unit are indicated and match the longer interruptions in operation from Appendix I, Table 1. During the April/May 1997 operating period, the evidence was unclear whether the decline in η was a result of a decline in catalyst activity or hydrodynamic effects related to the increase in resistance coefficient for the gas sparger. Upon restarting the LPMEOHTM Demonstration Unit in June of 1997, the value of η was determined to be unaffected by the magnitude of the sparger resistance coefficient. It appears that catalyst activity is declining more rapidly than expected.

A catalyst slurry sample was taken during the May/June 1997 complex outage. Due to a change in procedures for handling reduced catalyst in the laboratory, analysis of this sample for copper crystallite size, surface area, and the presence of catalyst poisons will not be performed until July of 1997.

Overall, the LPMEOHTM Demonstration Unit operated well during the initial campaign. The availability of the LPMEOHTM Demonstration Unit was 94.9% during the reporting period. All methanol produced (a total of 2,900,692 gallons) was used by Eastman in the production of methyl acetate, and ultimately cellulose acetate and acetic acid. The start-up was successfully completed in a safe and environmentally sound manner.

Methods of Calculation

As described in Section 6.2 of the Demonstration Test Plan, a comprehensive set of the formulas used to calculate key performance parameters of the LPMEOHTM Process was to be included in the first Technical Progress Report for Task 3.2.1 - Methanol Operation. These calculations are provided in Appendix L.

Task 3.2.2 DME Design, Modification and Operation

No activities occurred in this Task during the reporting period.

Task 3.3 On-Site Testing (Product-Use Demonstration)

No activities occurred in this Task during the reporting period.

Task 3.4 Off-Site Testing (Product-Use Demonstration)

No activities occurred in this Task during the reporting period.

Task 3.5 Data Analysis and Reports

The results of the data analysis for the operation of the LPMEOH™ Demonstration Unit are reported under Task 3.2.1 (Methanol Operation).

Task 3.6 Planning and Administration

An interim project review meeting was held on 29 and 30 April 1997 in Allentown. Attendees from Air Products and DOE participated. An update on the performance of the demonstration unit was provided. The catalyst targets and corresponding economics for a commercially successful LPDME catalyst were reviewed; these and other comments from DOE were incorporated into the DME recommendation (issued 30 June 1997). The status of the updated product-use test plan was also discussed. The meeting agenda, extracts from the meeting handouts, and the meeting notes are included in Appendix M.

The Milestone Schedule Status Report and the Cost Management Report, through the period ending 30 June 1997, are included in Appendix N. These two reports show the current schedule, the percentage completion and the latest cost forecast for each of the Work Breakdown Structure (WBS) tasks. The demonstration unit was mechanically complete on 31 January 1997. Ninety-eight percent (98%) of the \$38 million of funds forecast for the Kingsport portion of the LPMEOHTM Process Demonstration Project for the Phase 1 and Phase 2 tasks have been expended (as invoiced), as of 30 June 1997. Five percent (5%) of the \$158 million of funds for the Phase 3 tasks have been expended (as invoiced), as of 30 June 1997.

Start-up activities were completed during the reporting period, and the initial methanol production from the demonstration unit occurred on 02 April 1997. The first extended stable operation at the nameplate capacity of 80,000 gallons per day (260 TPD) took place on 06 April 1997. The demonstration unit was shut down on 08 May 1997 as part of a scheduled complex outage for the Kingsport site. After completion of maintenance activities, the demonstration unit was restarted on 17 June 1997, and maintained stable operation through the remainder of the reporting period. Details of the operating activities are provided under Task 3.2 of this report.

Preparations for the plant dedication ceremony, scheduled for 25 July 1997, began in earnest. Participants are expected to include senior management from Air Products, Eastman, and DOE.

A press release on the start-up of the LPMEOHTM Demonstration Facility was issued on 21 May 1997. A copy of the press release, as well as a sample of other publications which reported on the start-up of the demonstration unit, are included in Appendix O.

An update of the Project Management Plan was submitted to DOE on 30 June 1997. This version summarizes the reporting structure during Tasks 1 and 2, and lists the current team members for Air Products, Eastman, and Acurex.

The monthly reports for April, May, and June were submitted. These reports include the Milestone Schedule Status Report, the Project Summary Report, and the Cost Management Report. All Quarterly Technical Progress Reports through 31 March 1997 have been approved by DOE. DOE and Air Products agreed to delay the publication of the Demonstration Technology Start-up Report until issues related to the oil make-up pump and the reactor sparger have been resolved (refer to Task 3.2 for the status of these items).

E. Planned Activities for the Next Quarter

- Resolve any issues associated with the gas sparger in the reactor and with the oil make-up pumps. Upon resolution of these items, write and submit the Demonstration Technology Start-up Report to DOE.
- Analyze catalyst slurry sample taken during May/June 1997 complex outage to determine causes for deactivation of methanol synthesis catalyst.
- Continue executing Phase 3, Task 2.1 Methanol Operation per the Demonstration Test Plan.
- Receive concurrence from DOE on the DVT Recommendation for a DME proof-of-concept test run at the LaPorte AFDU.
- Receive concurrence from DOE on the Off-Site, Product-Use Test Plan (Phase 1, Task 1.4).
- Hold a Project Review Meeting in Kingsport in July, in conjuntion with the 25 July dedication ceremony.
- Incorporate DOE comments into the Topical Report on Process Economic Studies.

F. Conclusion

During this quarter, comments from the DOE on the Topical Report "Economic Analysis - LPMEOHTM Process as an Add-on to IGCC for Coproduction" were received. The study concludes that methanol coproduction, with IGCC electric power utilizing the LPMEOHTM process technology, will be competitive in serving local market needs.

A recommendation to continue with DME design verification testing was made. DME design verification testing studies show the liquid phase DME (LPDME) process will have a significant economic advantage for the coproduction of DME for local markets. The market applications for DME are large. An LPDME catalyst system with reasonable long-term activity and stability is being developed. Planning for a proof-of-concept test run at the LaPorte Alternative Fuels Development Unit (AFDU) was recommended. A recommendation document summarizing catalyst targets, experimental results, and the corresponding economics for a commercially successful LPDME catalyst was issued on 30 June 1997.

The off-site, product-use test plan was updated in June of 1997. During this quarter, Acurex and Air Products screened proposals for this task by the likelihood of the projects to proceed and the timing for the initial methanol requirement. Eight sites from the list have met these criteria. The formal submission of the eight projects for review and concurrence by the DOE will be made during the next reporting period.

An interim project review meeting was held in Allentown in late April of 1997. An update on the performance of the demonstration unit was provided, and the status of the DME recommendation and the off-site product-use test plan were discussed.

The site paving and final painting were completed in May of 1997. Start-up activities were completed during the reporting period, and the initial methanol production from the demonstration unit occurred on 02 April 1997. The first extended stable operation at the nameplate capacity of 80,000 gallons per day (260 TPD) took place on 06 April 1997. Pressure drop and resistance coefficient across the gas sparger at the bottom of the reactor increased over this initial operating period. The demonstration unit was shut down on 08 May 1997 as part of a scheduled complex outage for the Kingsport site. During this outage, the gas sparger was removed, cleaned, and reinstalled. After completion of other maintenance activities, the demonstration unit was restarted on 17 June 1997, and maintained stable operation through the remainder of the reporting period. Again, the gas sparger showed an increase in pressure drop and resistance since the restart, although not as rapidly as during the April-May operation. Fresh oil was introduced for the first time to a new flush connection on the vapor inlet line to the reactor; the flush lowered the pressure drop by 1 psi. However, the effects were temporary, and the sparger resistance coefficient continued to increase. Additional flushing with both fresh oil and entrained slurry will be attempted in order to stabilize the sparger resistance coefficient.

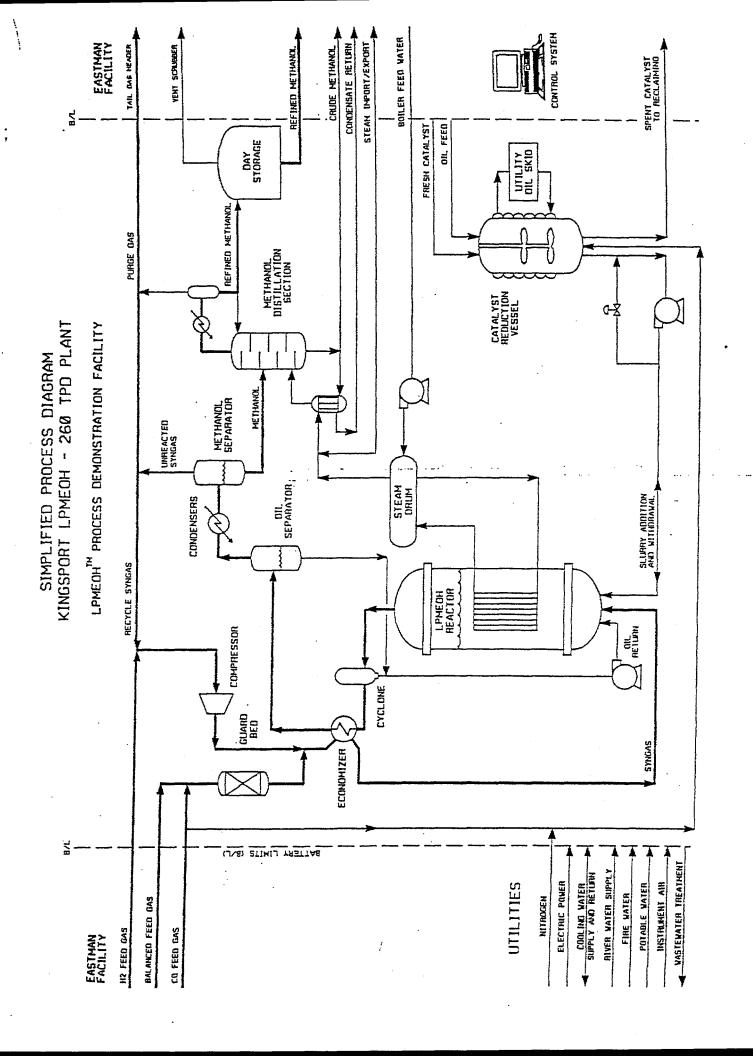

Catalyst activity, as defined by the ratio of the rate constant at any point in time to the rate constant for a freshly reduced catalyst (as determined in the laboratory autoclave), declined more rapidly than expected. A catalyst slurry sample was taken during the May/June 1997 complex outage for analysis.

Overall, the LPMEOHTM Demonstration Unit operated well during the initial campaign. The availability of the LPMEOHTM Demonstration Unit was 94.9% during the reporting period. All methanol produced (a total of 2,900,692 gallons) was used by Eastman in the production of methyl acetate, and ultimately cellulose acetate and acetic acid. The start-up was successfully completed in a safe and environmentally sound manner.

Ninety-eight percent (98%) of the \$38 million of funds forecast for the Kingsport portion of the LPMEOH™ Process Demonstration Project for the Phase 1 and Phase 2 tasks have been expended (as invoiced), as of 30 June 1997. Five percent (5%) of the \$158 million of funds for the Phase 3 tasks have been expended (as invoiced), as of 30 June 1997.

COMMERCIAL-SCALE DEMONSTRATION OF THE

LIQUID PHASE METHANOL (LPMEOH™) PROCESS COOPERATIVE AGREEMENT NO. DE-FC22-92PC90543

PROJECT EVALUATION PLAN FOR BUDGET PERIOD NO. 2

The work to be performed during Budget Period No. 2 consists of Phase 1 Design and Phase 2 Construction of the LPMEOHTM Process Demonstration Facility at Eastman Chemical Company's integrated coal gasification facility located in Kingsport, TN. Completion of these Budget Period No. 2 activities will essentially ready the LPMEOHTM Process Demonstration Facility for commissioning, startup, and operation to begin in the final Budget Period No. 3. The Statement of Work for the Project subdivides these Phase 1 and Phase 2 activities into Tasks. This Project Evaluation Plan for Budget Period No. 2 will meet the following criteria aligned by the Statement of Work tasks:

1. Phase 1 - Task 2 - Permitting

- Issue the final Environmental Information Volume to support the U.S. Department of Energy's (DOE's)
 Environmental Assessment/Finding of No Significant Impact.
- Obtain permits necessary for construction and operation.

2. Phase 1 - Task 3 - Design Engineering

- Complete the design engineering necessary for construction and commissioning.
 This includes Piping and Instrumentation Diagrams, Design Hazard Reviews,
 and conducting design reviews.
- Prepare the Environmental Monitoring Plan.

3. Phase 1- Task 4 - Off-site Testing (Definition and Design)

Prepare the fuel-use demonstration plan for Phase III, Task 4 Off-site Product
Use Demonstration. This off-site test plan will be incorporated into the overall
product-use test plan (in Phase 1, Task 5).

4. Phase 1 - Task 5 - Planning, Administration and DME Verification Testing

- Update the (fuel and chemical) product-use test plan, that will better meet the technical objectives of the Project and serve the needs of commercial markets.
- Complete economic studies of the important commercial aspects of the LPMEOH™
 Process to enhance Integrated Gasification Combined Cycle (IGCC) electric power
 generation. These studies will be performed by Air Products and Chemicals, Inc.
 and the Electric Power Research Institute, and used to provide input to the
 LPMEOH™ Process Demonstration Facility operating test plan (Phase 2, Task 5).
- Perform initial Design Verification Testing for the production of dimethyl ether (DME) as a mixed coproduct with methanol. This activity includes laboratory R&D and market economic studies.
- Submit all Project status, milestone schedule, and cost management reports as required by the Cooperative Agreement.

5. Phase 2 - Task 1 - Procurement

 Complete the bidding and procurement for all equipment and Air Products supplied construction materials.

6. Phase 2 - Task 2- Construction

- Complete mechanical construction so that checkout and commissioning can be started in Budget Period No. 3.
- Erect the major equipment and structural steel. Install the large bore piping, electrical, and insulation such that instrument checkout and equipment commissioning work can be completed during the 60-day Continuation Application approval period.
- Provide construction management for contractor coordination and compliance with design, construction, and quality control standards.

7. Phase 2 - Task 3 - Training and Commissioning

- Prepare a four (4)-year test plan for Phase 3, Task 2-Operation.
- Prepare the operating manual and initiate the operator training program.

8. Phase 2 - Task 4 - Off-Site Testing (Procurement and Construction)

• Prepare the final off-site product-use test plan.

9. Phase 2 - Task 5 - Planning and Administration

- Prepare annually an updated plan for the remaining activities. The first
 annual plan will update the remaining Phase I and Phase II tasks. The second
 annual plan will include an updated Phase III Operating Plan, identifying
 specific goals and milestones for the first twelve months of operation, and a
 general plan for the remaining years to achieve the Project's market penetration
 objectives.
- Submit all Project status, milestone schedule, and cost management reports as required by the Cooperative Agreement.

Completion of the above work activities will essentially ready the LPMEOH™ Process

Demonstration Facility for commissioning, startup, and operation to begin in the final

Budget Period No. 3. These criteria will be the basis of the Project Evaluation Report which
shall be submitted to the DOE for approval along with the Project Continuation Application,
at least 60 days before the end of Budget Period No. 2. Construction of the Facility will be
essentially completed during the 60-day approval period for the Continuation Application.

At the time that the Project Evaluation Report for Budget Period No. 2 is submitted with the Continuation Application; Air Products will also prepare an update on the expected technical and economic performance of the mature unit. This update will demonstrate the commercial potential of the LPMEOHTM process technology to enhance IGCC electric power generation with coproduct methanol. This IGCC enhancement is expected to reduce the cost of electricity for retrofit, repowering, replacement, and new applications for electric power generation from coal.

Subject:

Revised Fuel Test Plan

Dear Peter:

Glad we could meet this past April 18. I believe the meeting was quite fruitful in firming up our lines of communication and in making progress toward a final list of field test demonstration opportunities. I have enclosed a revised fuel test plan that includes the changes we agreed to at the meeting and via follow-up conversations I have held with Bob Senn. Please, call if you have any additional input. I look forward to get these quick start projects underway.

Sincerely,

Carlo Castaldini

Manager, Process Engineering

Project Name:

Demonstration of LPMEOHTM in Light-Duty Flexible Fueled Vehicle

(Acurex-owned)

Objective/Purpose

Demonstrate LPMEOHTM in a light-duty flexible fueled vehicle.

• Provide cost-effective demonstration with already proven hardware.

Scope of Work

- Operate Acurex-owned Ford Taurus FFV with LPMEOHTM M85 and regular M85 for 2 months on each fuel.
- Ship, locate fuel drum at Acurex for blending LPMEOHTM-M85.
- Secure permitting and containment vessels for storage.
- Install fuel pump and dispenser.
- Track fuel economy during test periods for both fuels.
- Perform emissions testing on LPMEOHTM and M85 at CAVTC.
- Write short report containing emissions results and fuel economy comparison.

Status

- High-visibility, cost-effective project.
- Can be performed immediately.
- Possible synergy with NREL DISC engine and methanol formulations projects.

Further Actions

- Await go ahead from Air Products.
- Call NREL and identify methanol formulation interests.

Costs

Total Funds: \$55k AP Funds: \$30k Cost Share: \$25k

Project Name: Demonstration of LPMEOHTM in DISC Engines

Objective/Purpose

• To demonstrate LPMEOHTM in new light-duty methanol Direct Injection Stratified Charge (DISC) engines under development by DOE-sponsored research companies in the United States.

Scope of Work

- Undefined.
- Demonstration would likely test LPMEOHTM versus standard M100 in a test-bench prototype engine.
- · Perform bench emissions testing.
- Provide fuel for demonstration.

Status

- DISC engine currently being introduced for gasoline light-duty vehicles.
- Early development work undertaken on methanol DISC engines.
- Uncertain participation by engine developers.
- DOE already funding these sources.

Further Actions

• None. Project likelihood remote given timeframe of implementation and coordination problems with DOE and developers.

Project Name:

Demonstration of Hydrogen Production from LPMEOHTM for Use in

Hydrogen Powered Vehicles

Objective/Purpose

- To demonstrate local hydrogen generation for vehicle fueling and commercial hydrogen production
- To determine emissions from hydrogen production and verify low fuel cycle emissions for fuel cell powered zero emission vehicle candidates
- Verify suitability of LPMEOHTM as a feed for partial oxidation hydrogen generation systems

Scope of Work

- Review facility siting options at the UC Riverside College of Engineering Center for Environmental Research and Technology (CE-CERT).
- Purchase partial oxidation reformer configured for methanol operation
- Design system for hydrogen compression
- Obtain permits
- · Prepare site
 - Electrical, controls, and equipment footings
 - Methanol and back up natural gas plumbing
- Install a methanol to hydrogen generation system
- Start up facility
 - Coordinate LPMEOHTM supply
 - Perform shake down testing
- Measure emissions from hydrogen generation system to support hydrogen as an equivalent to electric vehicles.
 - Evaluate emissions in terms of g/100scf, g/mi for fuel cell vehicle
- Install hydrogen compression equipment
 - Purchase compressor and gas storage
 - Operate facility for vehicle fueling and commercial hydrogen generation
- Prepare Final Report

Status

- Project team includes CE-CERT and Hydrogen Burner Technology
- Methanol storage tank is available at CE-CERT.
- An IC engine truck, research fuel cell vehicle, as well as commercial hydrogen are end use options
- Hydrogen compression experience with CE-CERT solar hydrogen facility.

Further Actions

- Determine cofunding opportunities from SCAQMD to fund compressor system integration.
- Review site options and hydrogen distribution options
- Certify safety of hydrogen tanks

<u>Costs</u>

Total Funds: \$475k AP Funds: \$328k Cost Share: \$147k

Project Name: Demonstration of LPMEOHTM in PEM Fuel-Cell Powered Vehicles

with On-Board Hydrogen Supply

Objective/Purpose

• Potential application of hydrogen production from methanol

Scope of Work

- Undefined.
- Operate fuel cell transit bus on LPMEOHTM and M100 in revenue service for 2 months for each fuel.
- Ship LPMEOHTM fuel to host site.
- Coordinate logistics of tracking fuel use.
- Track fuel economy during test period for both fuels.
- Provide vehicle troubleshooting and repair.
- Write report containing emissions results and fuel economy comparison.

Status

• A fleet of hydrogen powered fuel cell golf carts is operating in the city of Palm Desert (east of Los Angeles). Hydrogen is provided from solar energy. Praxair may be providing hydrogen also.

Further Actions

• None. Funding uncertainties and the large number of project participants do not make this the best opportunity to demonstrate hydrogen production from methanol.

PRIORITY: HIGH AVAILABILITY: HIGH

Project Name:

Demonstration of LPMEOHTM in Stationary Gas Turbine with VOC

Control for Distributed Power-Phase I

Objective/Purpose

• To demonstrate VOC destruction and low NOx emissions using a 25 kW stationary gas turbine fired with LPMEOHTM. Phase I of a two-phased project

Scope of Work

- Select and secure a local host facility (bakery) for VOC-control demonstration
- Perform a site visit a make presentation of project
- Procure and arrange for delivery of a 25 kW Capstone turbine
- Perform engineering analysis and installation review
- Select method for VOC destruction (eg high temperature in combustor or low temperature in recuperator)
- Coordinate catalyst and other turbine modification equipment retrofit
- Install Capstone turbine at bakery demonstration host site.
- Arrange for short-term methanol storage tank.
- Ship LPMEOHTM fuel to host site.
- Operate for 2 weeks running VOC laden gas through turbine for destruction.
- Perform source emissions testing.
- Write emission test result report

<u>Status</u>

- Small VOC industrial sources have few VOC-destruction cost effective solutions
- California SIP has targeted bakery, and other small VOC sources, for VOC control.
- Acurex has made preliminary contact with some bakeries that are willing to explore the VOC destruction with electric power generation
- California AB1890 funds would provide cofunding for project for Phase II power generation demo.

Further Actions

- Track progress of AB1890 and bid opportunities
- Find potential host site (John O'Sullivan of EPRI will assist with finding utility)
- Explore permit issues with local air district
- Make preliminary inquiries with Capstone Turbines regarding cost and methanol conversion
- Initiate look at VOC consumption rates

Costs (PHASE I only)

Demonstration of LPMEOHTM in Stationary Gas Turbine with VOC

Control - Phase II

Objective/Purpose

- To demonstrate the long-term performance and economic validity of distributed power generation in connection with VOC destruction using a 25 kW stationary gas turbine fired with LPMEOHTM. Phase II of a two-phased project
- Project builds on Phase I installation to perform long-term power generation and economic analysis demonstration of the GT-VOC control concept

Scope of Work

- Obtain long-term operating permit from local district
- Secure Phase I host facility (bakery) for long-term distributed power & VOC-control demonstration
- Perform a site visit a make presentation of project
- Modify fuel storage for long-term demonstration
- Retrofit turbine for multiple approach to VOC destruction
- Arrange for connection to power grid and electricity sale contract
- Ship LPMEOHTM fuel to host site.
- Operate for 2 months with LPMEOH and natural gas running VOC laden gas through turbine for destruction during process operation and ambient air at all other times.
- Perform source emissions testing.
- Record power generation, fuel use, operating cycle, power sales and power usage
- Write performance and emissions test result report
- Write economic analysis and commercialization feasibility report

Status

- California AB1890 funds would provide cofunding for project for Phase II power generation demo.
- California AB 1890 promotes the use of distributed power in connection with VOC control
- Proposal preparation expected in February 1998.

Further Actions

- The execution of this project depends on the successful completion of Phase I
- Track progress of AB1890 and bid opportunities
- Find potential host site
- Explore permit issues with local air district

Costs (PHASE II only)

Demonstration of LPMEOHTM in a Water-Naphtha-Methanol Fueled

Bus

Objective/Purpose

• To demonstrate viability of LPMEOHTM in a water-naphtha emulsion (A-55) containing 3% methanol.

Scope of Work

- Operate a 22 foot paratransit bus in revenue service using LPMEOHTM and M100 as an emulsion ingredient for 2 months on each fuel.
 - Daily pickup and transport for disabled persons in Sacramento
- Ship LPMEOHTM fuel to emulsion-producer for mixing.
- Coordinate logistics of tracking fuel use at host site.
- Track fuel economy during test period for both fuels.
 - Develop a fuel tracking plan
 - Coordinate with host site
- Provide vehicle troubleshooting and repair.
- Write short report containing fuel economy comparison between fuels and with control vehicles.

Status

- Acurex managed bus project already exists and revenue service will begin in late spring.
- Emulsion-producer is interested in potential sources of cheaper methanol.

Further Actions

• Call A-55 to confirm participation and coordinate details of emulsification process.

Project Name:

Demonstration of LPMEOHTM in a Diesel/Methanol Emulsion Fuel for Aircraft Ground Support and Stationary Power Generation

Equipment

Objective/Purpose

- To demonstrate diesel/LPMEOHTM emulsion in AGE equipment at Air Force Bases
- To monitor the emission and performance of the emulsion fuel in comparison with conventional diesel

Scope of Work

- Secure a host facility at a US AFB
- Perform a site visit to finalize scope and site support
- Select emulsion fuel supplier (e.g. A-55)
- Identify/engineer engine modifications needed
- Select fuel storage option and arrange for fuel tank installation
- Prepare a test plan
- Perform field test consisting of emissions and performance evaluation
- Analyze data
- Prepare test report

Status

- USAFB at Tyndall has expressed significant interest
- AGE and power generation equipment is high on priority list for NOx reduction
- Completed preliminary contact with Tyndall AFB in Florida
- Obtained agreement from the Air Force to in principle participate in the demonstration
- Expression of interest from Environics Directorate
- Preliminary contact with emulsified fuel supplier completed
- Defined an initial scope of work pending approval

Further Actions

- Explore with US AFB at Tyndall (FL) and Brooks (TX) on AF support
- Formulate a preliminary level of effort and present it to Tyndall personnel for agreement
- Make preliminary arrangements

Demonstration of LPMEOHTM in Fuel-Cell Powered Bus with POX

Reformer

Objective/Purpose

• To determine viability of LPMEOHTM as a fuel for fuel cell powered buses operating with multifuel POX reformers.

Scope of Work

- Coordinate methanol operation with demonstration site and vehicle developers.
- Install above ground fueling station
- Ship LPMEOHTM fuel to host site.
- Coordinate logistics of tracking fuel use.
- Operate fuel cell transit bus on LPMEOHTM and M100 in revenue service for 2 months for each fuel.
- Track fuel economy during test period for both fuels.
- Provide vehicle troubleshooting and repair.
- Perform chassis emissions testing on diesel, LPMEOHTM, and M100.
- Write report containing emissions results and fuel economy comparison.

Status

- Very high visibility project with excellent potential for vehicle use of methanol.
- Currently, DARPA-funded project for development of fuel cell/reformer technology is underway. Program for testing PEM fuel cell bus has not been finalized.
- Though project appears to have initial support from fuel cell developer, they will not operate on-road bus until late 1998. The bus is designed for multifuel operation; however, modifications to the fuel system would be necessary for methanol operation.

Further Actions

- While project has high visibility value, current hardware development plans will not allow demonstration to start until 1999. Excellent project for follow-on funds.
- Monitor project development and inquire regarding the possibilities for methanol operation

Demonstration of LPMEOHTM Fuel-Cell Powered Bus with Steam

Reformer

Objective/Purpose

- To determine viability of LPMEOHTM as a fuel for fuel cell powered buses operating with steam reformers
- Demonstrate LPMEOHTM use in breadboard and bus operation

Scope of Work

• Follow-on to Florida Lab 25kW Fuel Cell project.

- Operate fuel cell transit bus on LPMEOHTM and M100 in revenue service for 2 months for each fuel.
- Ship LPMEOHTM fuel to host site.
- Coordinate logistics of tracking fuel use.
- Track fuel economy during test period for both fuels.
- Provide vehicle troubleshooting and repair.
- Write report containing emissions results and fuel economy comparison.
- Provide fuel for Phase IV developments.

Status

- Very high visibility project with excellent potential for vehicle use of methanol.
- IFC and Ballard are developing methanol steam reforming fuel cell powered buses for Georgetown University. The IFC system uses a high temperature (1500F, Ni Catalyst) reformer and the Ballard system uses a low temperature (500F, Cu/Zn Catalyst) reformer. The high temperature system should be able to reform all types of alcohols while the low temperature system may not convert hydrocarbons and other alcohols.
- The project steps include system design, breadboard development, vehicle integration, and field demonstration. Actual operation on methanol in buses is several years away.
- Demonstration sites have not been identified at this time

Further Actions

• Provide input to IFC and Ballard on LPMEOHTM specifications and availability. Inquire if the fuel is feasible for vehicle operation. Provide samples for laboratory testing.

Demonstration of LPMEOHTM in Stationary Fuel Cell Power

Generation Applications

Objective/Purpose

• To demonstrate the viability of LPMEOHTM for stationary fuel cell distributed power generation

Scope of Work

- Identify demonstration site and cost sharing
- Design modifications for methanol operation
- Procure fuel cell
- Procure and install above ground fuel tank and fuel supply system
- Prepare site and electrical generation interface
- Install fuel cell
- Perform emission testing on methanol and natural gas
- Collect operating data
- Prepare final report

Status

- IFC/ONSI fuel cells (PC25) operate on natural gas and LPG. There are about 60 installations around the world. The IFC system uses a high temperature (1500°F) steam reformer to produce hydrogen. This catalyst system could operate well on any grade of methanol.
- The IFC fuel cell system has not been configured to operate on methanol for stationary applications.
- DOE is supporting R&D for PEM fuel cells for vehicles and building cogeneration. The hydrogen generation will most likely be with a partial oxidation system that can operate on gasoline, natural gas, diesel, ethanol, and methanol.
- PEM fuel cell power generation system will not be available from the DOE program for 3 years.

Further Actions

- Monitor developments with stationary fuel cell projects. Make contact with EPRI, IFC, and project participants and explore opportunities for LPMEOHTM demonstration.
- Seek funding under AB1890 to fund a project
- Discuss requirements for methanol operation with IFC

Costs

Demonstration of LPMEOHTM in Gas Turbine Powered Hybrid Bus

Objective/Purpose

• To determine viability of LPMEOHTM as a fuel for turbine powered hybrid buses.

Scope of Work

- Install Capstone turbines in an Orion Bus Industries hybrid-electric bus.
- Install methanol fuel system on bus.
 - Determine appropriate design considerations
 - Identify, purchase, and install parts
- Reconfigure electronic control for operation with gas turbine.
 - Develop software modifications
 - Create hardware for interface between master controller and turbine
- Operate bus in revenue service using LPMEOHTM for 12 months.
- Ship LPMEOHTM fuel to host site.
- Coordinate logistics of tracking fuel use.
- Track fuel economy during test period.
 - Develop field, performance, and emissions test plan
 - Implement data collection procedures
- Provide vehicle troubleshooting and repair.
- Write report containing vehicle development description, vehicle demonstration results, emissions results and fuel economy comparison to control vehicles.

Status

- Extremely visible, high-potential project.
- Initial response from Capstone, OBI, and CE-CERT is very positive.
- Requires commitment of several participants and extra funding from local, state or federal agencies. Funding could come from FTA or ARB. Requires development of partnership with involved parties.

Further Actions

- Clarify interest of partners for project plan.
- Identify additional funding from other agencies, such as ARB or FTA.

Costs

Project Name: Demonstration of LPMEOHTM in Methanol Fueled School Bus

Objective/Purpose

• To determine viability of LPMEOHTM as a fuel for school buses.

Scope of Work

- Operate school buses in revenue service using LPMEOHTM and M100 for 2 months on each fuel.
- Ship LPMEOHTM fuel to host site.
- Collect data from on-board data acquisition systems and operating records:
 - Vehicle speed/mileage
 - Fuel consumption
 - Engine speed
 - Foot brake activation
 - Percent engine load
 - Percent throttle
 - Idle time
- Provide vehicle troubleshooting and repair.
- Interview drivers with evaluation questionnaire.
- Track fuel economy during test period for both fuels.
- Write short report containing fuel economy comparison between fuels and with control vehicles.

Status

- Host site Antelope Valley Schools Transportation Agency (AVSTA) reacted positively to idea.
- 15 MeOH buses are part of CEC demonstration -- fuel source change requires CEC approval.
- Approval of bus manufacturer (Carpenter) required to protect warranty
- 12,000 gal MEOH tank onsite for school bus fueling

Further Actions

- Get fuel specification sheet and MSDS for AVSTA, CEC, Carpenter, DDC, and OSHA needs
- Verify fuel compatibility for Carpenter M100 schoolbuses
- Contact CEC
- Contact Carpenter and estimate fuel quantity needs

Project Name:

Demonstration of LPMEOHTM in Transit Buses with DDC 6V-92TA

Engines

Objective/Purpose

Demonstrate LPMEOHTM use at transit agencies operating DDC 6V-92TA engines. Prove viability of LPMEOHTM in heavy-duty transit bus applications.

Scope of Work

- Operate methanol transit buses on LPMEOHTM and M100 for period of two weeks.
- Ship fuel to transit agency methanol storage tank.
- Coordinate refueling efforts.
- Track fuel economy during test periods for both fuels.
- Perform emissions testing on LPMEOHTM and M100 at LACMTA chassis dynamometer.
- Write short report containing emissions results and fuel economy comparison.

Status

- Already measured emissions from an MTA bus operating on M100, LPMEOHTM and LPMEOHTM with DME mixtures (December 1994) in cooperation with Air Products.
- LACMTA's fleet of methanol buses is making a transition to ethanol operation. MTA's organization is complex and the logistics of integrating LPMEOH use with a large fleet of buses would be costly.
- Kenawah Valley (KVRTA) was a planned site for methanol bus operation but they are no longer operating buses on methanol.

Further Actions

None. Extensive efforts with transit bus operation are not warranted given the availability of methanol engines and the logistics of fueling and data collection at transit agencies.

Project Name: Demonstrate of LPMEOHTM in Caterpillar Heavy-Duty Methanol

Engine

Objective/Purpose

• To demonstrate LPMEOHTM in a new M100 heavy-duty engine currently under development by Caterpillar.

Prove viability of neat-LPMEOHTM in heavy-duty methanol engines.

Scope of Work

- Undefined.
- Test LPMEOHTM versus standard M100 in a test-bench prototype engine.
- Perform bench emissions testing.

Status

• Caterpillar bench prototype engine will not be available within a year's time.

• Not certain if Caterpillar would be interested in demonstration of LPMEOHTM in their new engine.

Further Actions

• None.

HIGH

LOW

Project Name:

Demonstration of LPMEOHTM for Advanced Power Generation

Equipment

Objective/Purpose

- To test LPMeOHTM in the fuel cell reformer and gas turbine in advanced power cycle equipment being developed under DOE program
- To compare the performance and cost of the power plant with more conventional combined cycle fuels

Scope of Work

- Re-contact Solar R&D group later this year regarding progress and schedule
- Obtain agreement and firmup schedule
- Visit the site and secure final agreement
- Develop test plan and get it approved
- Arrange for delivery of LPMeOHTM and storage
- Monitor the testing and data gathering effort
- · Obtain data from the site
- Analyze data
- Write a test report

Status

- Acurex will take advantage of an ongoing project sponsored by DOE and performed by Solar
 Turbines Division of Caterpillar and Westinghouse where an advanced power generation cycle
 consisting of GT and fuel cell combination will be used to generate electricity with overall efficiency
 exceeding 65 percent. The equipment and technology is currently being assembled at Solar Turbines
 and is scheduled for multifuel testing later this year and in 1998
- Solar will consider methanol firing, including LPMeOHTM
- Preliminary contact made with Solar Turbines. Agreement in principle. Further negotiations are necessary

Further Actions

- Acurex will confirm the feasibility of the project later this year
- If deemed feasible to pursue, Acurex will continue contact to coordinate the scope of work and schedule

Project Name:

Demonstration of LPMEOHTM Cofire/Startup for Coal-Fired Boiler

Objective/Purpose

• To demonstrate the use of LPMeOHTM as a cofire or startup fuel for existing coal-fired industrial and small-scale power generation boilers in the Midwest. The LPMeOHTM fuel will be used in minimal amounts to support improved boiler operation, minimize emissions, and in general improve the reliability and performance of the boiler continuing its viability as a coal-fired boiler. The boiler that will be selected will be among the population of boilers recently retrofitted under the GRI gas cofire program. This will ensure that the boiler is already equipment ready for installation and firing of methanol fuel with minor modification of existing burner equipment

Scope of Work

- Define site selection criteria
- Survey boiler population for site selection
- Undertake phone search for site selection and securing preliminary agreement
- Make site visit and secure host facility for the demonstration
- Prepare a retrofit, equipment modification and test plan
- Subcontract the burner vendor to make modifications to the burner for methanol ready firing
- Arrange for delivery, storage, and hookup of fuel
- Perform startup and initial diagnostic tests
- Perform emission and performance tests in line with the test plan
- Arrange for site equipment to return to normal
- Analyze test data
- Write report

Status

Acurex has made preliminary contacts with the Illinois Clean Coal Institute (ICCI) to explore the
interest in this demonstration. Heman Feldmann. Preliminary interest pending on the economic
viability of LPMeOHTM as a cofire fuel compared with alternatives.

Further Actions

 Acurex will further explore interest in this demonstration following approval from all project stakeholders. The viability of the project will also hinge on securing cofunding using the open submittal of project ideas under the current ICCI open solicitation mechanism. Stakeholder approval and award of contract from ICCI following submittal of Acurex proposal will be followed up with the proposed scope of work described above. Level of ICCI cofunding is limited to \$250,000 per project.

APPENDIX D - TASK 1.5.2 - PROCESS ECONOMIC STUDY

Process Economics Study - Outline (Draft - 3/31/97 - four pages)

and

LPMEOHTM Process Economics - for IGCC Coproduction (Memo - 31 March 1997 - two pages)

Process Economics Study - Outline LPMEOH™ Process, as an add-on to IGCC for Coproduction

Part One - Coproduction of Methanol Note - 2nd Draft was dated 10/01/96; comments received 11/25/96, 3d Draft released ~03/31/97.

1. Introduction

1.. Process Design Options.

• Develop process flow diagram and plant design options for the LPMEOHTM process, for design variables such as: a) feed gas pressure, b) feed gas compositions, and c) % syngas conversion.

2. Liquid Phase (LP) Methanol Advantage versus Gas Phase (GP) Methanol.

2.1. Syngas Conversion Cost for Methanol Production from CO-Rich syngas.

- For the various LPMEOH™ process (LP) design options (from 1.1) develop plant capital and conversion costs derived from the Kingsport Project design and costs. Develop conversion costs for:
 - 500 t/d Plant size, with 500 psi feed gas pressure;
 - 500 t/d Plant size, with 1000 psi feed gas pressure
 - Impact of Plant Size on Conversion Costs
 - Summarize in a series of graphs, conversion costs, in cents per gallon over the range of syngas conversion from 18% (LP Once-through) to 94% (GP), for baseload annual coproduction operation. This will show LP's advantage at higher feed pressures and lower conversions; and will highlight areas for LP design development/demonstration improvements. (For future: include plant size impact on product distribution (freight) cost, assuming that local markets are served. Freight cost will increase with plant size, as the distribution radius increases.).

2.2. Methanol Product Purification Cost.

- Develop capital and operating costs for these product purification design alternatives:
 - MTBE Grade;
 - Fuel Grade:
 - Chem. Grade;

Over a range of feed gas compositions, summarize LP's advantage versus the GP process (in cents per gallon), especially for MTBE and Fuel Grade from CO-rich feed gas at low syngas conversions.

2.3. Feedgas (Syngas) Composition Variations; (Impact on LP vs. GP).

- Higher Sulfur content in the feedgas will have a negative cost impact on LP at low syngas conversion, relative to GP at high conversions. Conversely, higher feedgas inert content will have a negative relative cost impact on GP.
 - Sulfur content variation; over the above range of syngas conversion
 - Inert gas content variation; over the above range of syngas conversion

2.4. Syngas Usage (Btu per Gallon) - Impact on IGCC Power Plant.

• Summarize differences in syngas utilization (Btu per gallon of methanol), and in mass flow loss/gain to the combustion turbine (kwh production loss/gain per gallon of methanol); for the cases in 2.1 above.

Process Economics Study - Outline LPMEOH™ Process, as an add-on to IGCC for Coproduction

2.5. Summary of Cost Advantage(s) - (LP Vs GP).

• Summarize the cost impact (cents per gallon) of the above design variables and syngas utilization differences. Show the impact of methanol plant size on the conversion costs. Also (separately show) the impact of 90% and 70% annual load utilization for use with Section 4. - "Intermediate Load Coproduction and Stored Energy" of this Economics Study.

2.6. Recommendations for Further Study.

 Recommend areas for process design value engineering work; and areas for demonstration at Kingsport.

Part Two - Baseload Power and Methanol Coproduction

Note - Portions of Part Two, Section 3.1; was included in the Tampa CCT Conference's Paper, 1/9/97.

3. Baseload Coproduction with Methanol Sales - Impact on Electric Power Cost -

For baseload coproduction, the gasifier must be sized for both the power and methanol products. The results of Part One indicate the LP technology can make coproduction economic, even at small methanol plant sizes (400 to 1200 TPD) suitable to serve local markets near the power plant. The LP technology's advantage (over GP) is also greatest at the lower (up to 34%) Syngas Conversions which are consistent with these methanol plant sizes. A matrix of power plant and methanol plant sizes of interest, at up to 34% Syngas Conversion to methanol, is shown in the following tables. These examples are based on Advanced Gas Turbine Technology (reference (G.E.'s) published paper) with the base gasification plant sized for two gasifiers, of about 1735 x 10^6 Btu(HHV)/hr. output each (1626 x 10^6 LHV>

3.1 Gasification Plant Size Fixed

• With a given gasification plant size, the methanol plant and power plant can be sized to accommodate a range of Methanol to Power output ratio's.

Syngas	Power	Methanol	Methanol to	Gasification
Conversion	Plant Size	Plant Size	Power Ratio	Plant Size
0.0 %	$500 \; \mathrm{MW}$	0 T/D	0 T/D per MW	Base
13.8%	426 MW	500 T/D	1.2 T/D per NW	Base
20.0%	394 MW	691 T/D	1.8 T/D per MW	Base
30.0%	342 MW	1085 T/D	3.2 T/D per MW	Base

3.2 Power Plant Size Fixed

• With a given power plant size, the gasifier size may be increased to accommodate the coproduction of methanol. For Gasification Plant size increases of up to 50% (to say, three x 1735 x 10⁶ Btu(HHV)/hr. gasifiers), the methanol to power coproduction ratio's could be:

Syngas	Power	Methanol	Methanol to	Gasification
Conversion	Plant Size	Plant Size	Power Ratio	Plant Size
0.0 %	500 MW	0 T/D	0 T/D per MW	1.00 x Base
16.7 %	500 MW	736 T/D	1.5 T/D per MW	1.20 x Base
25.0 %	500 MW	1227 T/D	2.5 T/D per MW	1.33 x Base
33.3 %	500 MW	1825 T/D	3.7 T/D per MW	1.50 x Base

• The impact of coproduction on electricity generation costs could be shown in graphs of electricity cost Vs. methanol net back price.

End of Part Two.

Process Economics Study - Outline LPMEOH™ Process, as an add-on to IGCC for Coproduction Part Three - Coproduction for Intermediate Electric Load Following.

4. Intermediate Load Coproduction

Note - Part Three, Section 4.2: is being developed as a paper for the June 1997 Power-Gen Europe Conference.

4.1. Syngas Value as a function of (time of day) Power Value.

Earlier electric power daily load following studies indicate that LPMEOHTM coproduction optimizes for daily or seasonal power peaks in the 500 to 2500 hr./yr. range. This means the methanol plant operates, during daily or seasonal "off--peak" power periods, in the 8260 to 6260 hr./yr. range, with stop/start operations for these on/off power peaks. This is the "intermediate load" area of a typical power grid system. (8760 hr./yr. = 100%; all exclude gasifier/plant outages)

4.1.2. Syngas value as function of seasonal opportunity fuels/feeds.

• Natural gas may be available seasonally, for use in the CC power plant, allowing syngas to be used for conversion in an LPM add-on. Other feeds?

4.2. Intermediate Load Coproduction - for Methanol Sales.

• For intermediate load coproduction cases, redundant investment to utilize syngas is required; so that when the methanol plant shuts down during peak power periods, all of the syngas can be converted to electric power. There are several intermediate load coproduction power plant design choices; a) a CC power plant turned down, or b) a baseload CC power plant with other CC or CT power plant(s) for peak. These may be combined with methanol plant design choices such as size/% syngas conversion. To evaluate the system properly, time of day power values (also called Lambda Curves) are needed. The Lambda Curve examples from published EPRI studies can be used for initial evaluations. The Section 2.(above) Methanol Plant design choices can then be combined with power plant design options, to optimize the system.

4.3. Intermediate Load Coproduction, for Methanol Sales and for Dispersed Power.

Dispersed power can provide electricity and heat locally, at the use point, eliminating the
need for new power distribution lines in congested areas. The world wide package (0.2 MW to
10 MW) power plant market is large, and growing. A variety of technologies (combustion
turbine, internal combustion engine, fuel cell) are being packaged. Methanol produced at a
nearby IGCC power plant during off-peak power periods could provide clean local (peak)
power; bypassing the local electric power distribution system.

4.4. Intermediate Load Stored Energy Production, with Methanol Fuel for Peak Power Production.

- When other peaking fuels are not available, or are too expensive, then methanol may also be used as a peaking fuel. The design optimization for this is quite complex. The IGCC/OTM plant design has an additional variable: the peaking power plant size and hours of operation is an independent variable. A study option would be to compare ourselves (IGCC/OTM) to the various published EPRI (IG-Cash, et. al.) studies, which provide Lambda Curve examples for energy storage. However, selling methanol and using distillate fuel for peaking, is the economic choice at currently forecasted world oil and methanol prices. Therefore, this study should have low priority, until a site specific need is identified.
- Methanol could be transported to remote existing, or to new peaking power plants, to unload grid systems.
- When other back up fuels are not available, or are too expensive, then methanol may also be used to enhance power plant availability. Coproduction with multiple gasifier trains may also be used to enhance power plant availability. (e.g. Three by 50%, where Baseload Power = 2 x 50%; Peaking Power = 1x 50% plus methanol fuel; Methanol Plant = 1 x 50%, but operates only when all three gasifiers are operating and peak power is not required.)

End of Part Three.

Process Economics Study - Outline LPMEOH™ Process, as an add-on to IGCC for Coproduction

Part Four - Methanol Fuel Applications

5. Premium Methanol Fuel Applications

- At 46 cents per gallon, methanol as a fuel (\$6.90 per mmBtu) will not compete with oil in most applications (\$20/bbl crude = \$3.30/mmBtu; \$27/bbl diesel = \$4.50 /mmBtu). However, methanol coproduced at a central IGCC power station, may be a valuable premium fuel for two evolving developments: as an economical Hydrogen source for small fuel cells, and as an environmentally advantaged fuel for dispersed electric power.
- "Central clean coal technology processing plants, making coproducts of electricity and methanol; to meet the needs of local communities for dispersed power and transportation fuel" meets the DOE Clean Coal Technology Program's objectives. Serving (initially) small local fuel markets also builds on LP's (the LPMEOH™ process) strengths; good economics at small methanol plant sizes, fuel grade product distillation savings, and a freight advantage in local markets vis-à-vis large off-shore remote gas methanol. Baseload methanol coproduction studies show that 46 cent per gallon methanol can be provided from an abundant, non-inflationary local fuel source.. We need to arrange fuel tests to confirm the dispersed energy environmental advantage.

5. . Hydrogen Source for:

• Hydrogen fuel cells, being developed for transportation applications, can achieve 65% system efficiency, as compared to 45% for diesel IC engines and 32% for gasoline IC engines. Methanol is a storable, transportable liquid fuel which can be reformed under mild conditions to provide H2. For small H2 applications, and at low utilization factors, methanol reforming is a more economical source of hydrogen than: a) natural gas reforming, b) distillate (oil) reforming; and is cheaper than liquid H2.

5.1.1. Fuel Cells for Transportation

5.1.2. Fuel Cells for Stationary Power

(See also dispersed power below).

5.1.3. Industrial Applications - Small Hydrogen Plants

Small pressurized methanol reformers for transportation applications may be suitable for adapting to meet the needs of small commercial hydrogen gas requirements.

5.2. Dispersed Power

- Dispersed power can provide power and heat locally, at the use point, eliminating the need for new power distribution lines in congested city areas. The world wide package (0.2 MW to 10 MW) power plant market is large, and growing. A variety of technologies (combustion turbine, internal combustion engine, fuel cell) are being packaged. Methanol produced at a nearby IGCC power plant during off-peak power periods could provide clean local power; bypassing the local electric power distribution system.
- 5.3. Dimethyl Ether as an Enhancement to Methanol in Premium Fuel Applications
 Can coproduced mixtures of methanol and dimethyl ether improve upon methanol, in the above?

End of Part Four.

The third draft of the DOE Topical Report on LPMEOH™ Process Economics (Part One) is attached for your use (review, comment). This Topical Report develops plant design options for our LPMEOH™ process, as an add-on to IGCC power plants for the coproduction of methanol and power. Part One also compares our LPMEOH™ (LP) methanol process with the gas phase (GP) methanol process.

LP's advantage over GP is about 10 cents per gallon; when the syngas conversion is low (less than 34%), and when the feed gas pressure is high (greater the 750 psig), and when the methanol plant size is relatively small (400 to 1200 TPD). Surprisingly, even at these small plant sizes, the LP technology can coproduce methanol at less than 50 cents per gallon (good). The GP technology is over 50 cents per gallon (not good). Therefore, when baseload IGCC power is viable, the LP Technology makes coproduction viable.

The DOE Topical Report (Part One) looks specifically at:

- Determining and optimizing **conversion costs** for our LP technology as a function of feed gas pressure and % syngas conversion. (See graphs on pages A 5, 6, 7, 9, 10).
- Determining purification (distillation) costs for "Fuel", "MTBE", and "Chemical" grade methanol. (See graph, page A 15). Distillation savings are a significant part of LP's advantage.

- Comparing LP with GP technology. (See the above graphs, plus Summary Table on page 16).
- Listing of **future LP design improvements**, expected from actual operation, or that are recommended for further engineering study (see pages 17,18).

Parts Two, Three and Four of the DOE Topical Report are planned for the future (the outline is attached). Part Two will examine the impact of baseload coproduction on electric power costs. Part Two, Section 3.1 was included in the Tampa CCT Conference's Paper; "Fuel and Power Coproduction" (1/9/97). Part Three will look at time-of-day energy values: a) intermediate load coproduction (e.g.- off-peak methanol production), and b) methanol as stored energy for peaking and/or dispersed electric power. Part Four of the Topical Report plans to look at Methanol Fuel Applications, where locally produced (non-inflationary) methanol, at less than 50 cents per gallon, could be a viable source of hydrogen for industrial or fuel (cells) power applications. Serving (initially) small local fuel markets builds on LP's strengths; good economics at small plant sizes, fuel grade product distillation savings, and a freight advantage in local markets vis-a-vis large off-shore remote gas methanol.

Your comments on this third draft of the Topical Report(Part One) would be appreciated. After your further comments are received; we will formally release this as the final (draft) of a Topical Report.

Liquid Phase Methanol Demonstration Project

Liquid Phase Dimethyl Ether Design Verification Testing -

Recommendation

Dear Bob:

The updated version of the Recommendation to proceed with Design Verification Testing of the Liquid Phase Dimethyl Ether Process is attached. This document will be used during the Project Review Meeting on 24-25 July, at which time final approval by DOE and the Partnership will be requested.

Very truly yours,

Edward C. Heydorn Program Manager

LPMEOHTM Demonstration Project

LPDME Recommendation

Summary

From the Statement of Work, "Commercial-Scale Demonstration of the Liquid Phase Methanol (LPMEOHTM) Process," selected under Round 3 of the U.S. Department of Energy's (DOE's) Clean Coal Technology (CCT) Program: "Subject to Design Verification Testing (DVT), the Partnership proposes to enhance the Project by including the demonstration of the slurry reactor's capability to produce DME (dimethyl ether) as a mixed coproduct with methanol." The first DVT step (Phase 1, Task 5), to address issues such as catalyst activity and stability, to provide data for engineering design, and to verify the market through engine tests and through market and economic study, is now complete. The market potential for DME is large, and progress in the laboratory toward developing a catalyst system whose performance meets the economic targets of a methanol equivalent productivity of 14 mol/kg catalyst-hr after 6 months of operation, producing at least 75% (by heating value) DME and 25% methanol.

A test of the Liquid Phase Dimethyl Ether (LPDME) at the LaPorte Alternative Fuels Development Unit (AFDU), in conjunction with the DOE's Liquid Fuels Program, would be appropriate if the catalyst system development can be completed successfully. An implementation decision, made mutually by the DOE's Clean Coal Technology LPMEOHTM project participants, and by the DOE's Liquid Fuels Program participants, should be made (by <u>July of 1997</u>) to implement testing at LaPorte in <u>early 1998</u>. (Final <u>dates</u> should be recommended by the DOE's Liquid Fuels Program, based on progress in developing the LPDME catalyst system).

Liquid Phase Dimethyl Ether (LPDME) Design Verification Testing (DVT)

From the Statement of Work, DOE's CCT LPMEOHTM project (Cooperative Agreement No. DE-FC22-92PC90543): "Subject to Design Verification Testing (DVT), the Partnership proposes to enhance the Project by including the demonstration of the slurry reactor's capability to produce DME as a mixed co-product with methanol. The production of DME from synthesis gas is a natural extension of the LPMEOHTM process in that three reactions occur concurrently in a single liquid phase reactor, methanol synthesis, methanol dehydration and water-gas shift. This process enhancement can significantly improve the overall conversion of coal derived synthesis gas to a storable blend of methanol and DME. -- -- the enhanced (DME production demonstration is complementary to ongoing studies being sponsored by DOE's Liquid Fuels Program --) -- . -- At the conclusion of each of the DVT steps, a joint Partnership/DOE decision will be made regarding continuation of methanol/DME demonstration.."

The first DVT step (Phase 1, Task 5), to address issues such as catalyst activity and stability, to provide data for engineering design, and to verify the market through engine tests and through market and economic study, is now complete.

LPDME Recommendation

The LPDME Process Concept: - Three Concurrent Reactions:

• $2 \text{ CO} + 4 \text{ H}_2 = 2 \text{ CH}_3\text{OH}$ (Methanol Synthesis).

• 2 CH3OH = 1 CH3-O-CH3 + 1 H2O (Methanol Dehydration).

• 1 CO + 1 H₂O = 1 CO₂ + 1 H₂ (Water-gas Shift).

The overall reaction, with carbon monoxide (CO)-rich synthesis gas (syngas), in a single liquid phase (slurry) reactor:

• 3 CO + 3 H₂ = 1 CH₃-O-CH₃ + 1 CO₂ (DME from CO-rich syngas)

This is the "once-through" CO-rich syngas concept for the LPDME process utilizing a single slurry reactor. Conversion per pass, with CO-rich syngas, can be higher than for the LPMEOHTM process. Methanol may also be produced, as a mixed co-product with the DME, and can easily be separated and recovered. The separation of DME from carbon dioxide (CO₂) will be necessary for certain market applications.

Status of the LPDME DVT Work

The status of a) the LPDME process economics/market study work, and of b) the LPDME catalyst system R&D work, follows:

A-1. The market applications for DME are extensive. DME is, or may be, used as:

- Aerosol Small, but established market. High purity DME is required.
- Cooking Fuel Potentially a large market, to replace imported liquefied petroleum gas (LPG). There is a lot of interest in China, and DME is on the agenda for DOE's Pittsburgh Coal Conference in China (Sept. of 1997). Purity, of about >95% DME, with <2% methanol, < 3% CO2 is estimated. An unresolved application issue is CO emissions during cooking. How does DME purity impact this? Use testing is needed.</p>

Our contacts with representatives from the Institute of Coal Chemistry of the Chinese Academy of Sciences in Shanxi has provided the following assessment of the potential market for DME as a cooking fuel:

Of the 1.2 billion people in China, 0.3 billion live in cities. Of these, 1/3 currently use natural gas or LPG. Assuming 4 people per family, the 0.2 billion people who do not use gas or LPG converts to 50 million families. If DME captures 20-30% of the market share for these new applications, and the DME consumption is 200 kg per family per year, the demand for DME would be 2.4-3.0 million tons per year.

• <u>Diesel Replacement Fuel.</u> DME is an ultra clean (high Cetane) diesel fuel; and an 80% DME mixture with methanol and water is now being engine-tested by others (Amoco, et. al.). Market development (at least in the U.S.) faces a fuel distribution infrastructure problem. DME might

more easily replace LPG in countries where LPG is already an engine fuel. Diesel use in the U.S. is projected to increase by 1.5 percent a year, assuming an economic growth of 1.9 percent a year. This will raise consumption from over 4 quadrillion BTU to approaching 6 quadrillion BTU (Reference 1). This corresponds to an annual increase of almost 1.4 million gallons per year of diesel consumption.

- DME Derivatives, as a Diesel Fuel Additive. Quotes from the DOE Liquid Fuels Program (Contract No. DE-FC22-95PC93052) quarterly report for April-June 1996: "Initial Cetane number (CN) testing of a three-component composition of 1,2-dimethoxy ethane, 1,1-dimethoxy methane and methanol blended with diesel fuel showed a 40% increase in the CN of the diesel fuel when the blend was 50/50." "The concept of adding a blend of oxygenated compounds to diesel fuel in order to enhance the Cetane value and cold start properties is being investigated. The blend of oxygenated compounds is derived from dimethyl ether chemistry, and builds on work conducted earlier --." The testing of this DME feedstock chemistry is in its early days, but it is possible that CO2 may not need to be separated from the DME prior to the production of DME derivatives. The 50/50 blend referenced above would therefore provide a large market opportunity for the projected U.S. market growth (Reference 1), let alone for the present consumption.
- <u>DME Derivatives, as Chemicals/Other Fuels.</u> DME is a key intermediate in a commercial synthesis gas-to-gasoline process, and is being developed as an intermediate for other chemicals and fuels as part of the DOE's Liquid Fuels Program. The fit for DME here is long-term.

A-2. The economics studies, for once-through coproduction (with an integrated gasification combined cycle (IGCC) power plant, for example) on synthesis gas rich in carbon oxides, show that the LPDME process will have an economic advantage greater than the LPMEOHTM process. A once-through LPDME reactor is able to convert greater than 50% of such a syngas, whereas a once-through LPMEOHTM reactor can convert only about 30%. The economics, of course, depend upon the end-use (purity) of the DME and upon the gasification plant's coproduct mix (amount of power, methanol, DME, etc.). The same liquid phase reactor design options to increase syngas conversion (Reference 2); such as feed gas compression and/or CO-rich gas recycle; are also be applicable for LPDME. So, the LPDME technology has the potential to improve on the 5-10 cents per gallon (methanol equivalent) advantage over the LPMEOHTM process for the coproduction of DME to serve local markets.

As with the LPMEOHTM process, gas phase process technology must be considered as the economic competitor. The gas phase DME process (Reference 3) must run with hydrogen (H₂)-rich syngas. In the IGCC coproduction flow sheet (shown in Figure 1), gas phase technology is at an economic disadvantage, since separate shift and CO₂ removal are required. As is the case for methanol, inexpensive remote natural gas would therefore be the economic plant site choice for gas phase technology. A comparison, of IGCC/LPDME coproduction with DME imported from remote gas facilities, shows an advantage of 20-30% for locally produced DME relative to

imported DME. The transportation cost to import DME is much higher than for methanol, and the LPDME coproduction advantage is even greater than that for LPMEOHTM (vs. methanol import) (Reference 2). Dehydration of imported methanol to make DME is not competitive either. Therefore, for DME in local markets, LPDME coproduction should be a winner!

With H₂-rich syngas, the LPDME process loses its (once-through, high conversion per pass) economic advantage. The overall reaction, with (> 2:1) H₂-rich syngas is:

Since water inhibits the methanol dehydration reaction, the slurry reactor must be staged, with water removal between stages. Staging could be by high ratio gas recycle, and/or with multiple reactors; but the once-through simplicity is lost. Therefore, it is unlikely that the LPDME process would be developed for use in H2-rich syngas applications.

A cost estimate of commercial-scale LPDME plants has been performed. This work has helped quantify the targets for the laboratory R&D program (summarized in Part B). From these studies, a commercially successful LPDME system is defined for a Texaco-type synthesis gas (35 mol% H₂, 51 mol% CO, 13 mol% CO₂) available at 500 PSIG. At a reactor operating pressure of 950 PSIG and a space velocity of 4,000 liters/hr-kg catalyst, the LPDME catalyst system must have a methanol equivalent productivity of 14 mol/kg catalyst-hr after 6 months of operation, producing at least 75% (by heating value) DME and 25% methanol. Figure 2 shows the effect of plant size on DME cost. These costs are competitive with LPG in China (Section A-1).

B. Laboratory R&D Results

Summary of work through end of funding by CCT LPMEOH™ Project (9/96): An LPDME catalyst system, with reasonable long-term activity (57% of initial activity after 1000 hours), productivity (equivalent methanol productivity of 29 mol/kg catalyst-hr), and selectivity (79% carbon selectivity to DME, CO₂-free basis), was identified and tested. The system exhibits best activity under CO-rich syngas conditions, i.e. those most likely for (IGCC) coproduction. Accelerated aging of the catalyst system is a remaining issue. Water concentrations in the liquid phase reactor are higher with syngases richer in H₂, and its effect needs to be evaluated.

Laboratory work has continued under the DOE's Liquid Fuels Program. The issues, to be addressed in the lab before a decision on a test run at the DOE's AFDU in LaPorte, are:

- 1) Understanding the LPDME catalyst system's accelerated aging; and modifying the catalyst and/or the system operating conditions; and
- 2) Manufacturing scale-up of catalyst for a LaPorte AFDU run.

Progress has been made in the laboratory effort. Figure 3 shows the performance for the first DME catalyst which was tested; goals from the Liquid Fuels Program are provided for reference. After further study, an improved DME catalyst (AB-05) was tested with two LPMEOH™ catalysts (S3-86 and MK-101); the results of a 700 hour life study are presented in Figure 4. When compared with the program goals (summarized in Figure 5), the catalyst performance of the newer catalyst is approaching the commercial targets defined in Section A. The status of the laboratory program is summarized in the following table:

	Liquid Fuels Program Goals	Commercial Targets	Laboratory Results			
Catalyst Productivity,	> 28 (Initial Productivity)	> 14 (productivity for	28 (Initial Productivity)			
mol/kg catalyst-hr		aged catalyst)				
(MeOH-equivalent)						
	DME Selectivity > 80%	DME = 75%,	DME Selectivity = 79%			
Catalyst Selectivity	(% Carbon, CO ₂ -free)	Methanol = 25%	(% Carbon, CO2-free)			
		(heating value basis)				
Catalyst Life	> 50% Remaining Activity	Target Productivity after	57% Remaining Activity			
	after 1000 hours	6 months of operation	after 1000 hours			

Initial discussions with catalyst manufacturers have been held. Once a manufacturer is selected, a laboratory-scale catalyst batch will be produced and tested in the autoclave to verify the production technique developed at Air Products. An interim 1 lb batch will then be produced and tested. Once the catalyst production techniques have been verified at this scale, the 200 lb LaPorte batch will be produced using the same methodology as for a full commercial batch. An autoclave check of this material will be performed prior to the start of the LaPorte AFDU run.

Recommendations

The catalyst system and the market applications/opportunities are sufficiently promising that proof-of-concept testing at the LaPorte AFDU is recommended. Kingsport is an unlikely site for the commercial size demonstration of LPDME, since there are limited times for CO-rich syngas testing; and H₂-rich syngas would create water buildup. Therefore, the basis for commercializing LPDME must come from:

1) catalyst performance (productivity, selectivity, and life) for the LPDME catalyst system under COrich syngas from the proof-of-concept testing at the LaPorte AFDU;

- 2) continuing work in hydrodynamics of slurry reactors (other ongoing DOE programs); and
- 3) reactor performance (methanol catalyst activity and life, hydrodynamics, and heat transfer) from the LPMEOH™ Process Demonstration Unit.

The tie-in between the laboratory and the LaPorte AFDU is important. Historically, the rate of deactivation of methanol synthesis catalyst has been greater in the autoclave than at the AFDU; this may be a result of loss of catalyst from the autoclave, or due to greater carbonyl poisoning as a result of the higher surface-to-volume ratio at the laboratory scale. Testing at the engineering scale of the LaPorte AFDU can eliminate this variable. Operation of the LPMEOHTM Process Demonstration Unit will provide data on catalyst life under coal-derived syngas and at the larger engineering scale (the tie-in to the LaPorte AFDU for commercialization).

The recommendations for proceeding with DVT of the LPDME catalyst system are:

- An LPDME test run at the LaPorte AFDU, in conjunction with the DOE's Liquid Fuels Program, would be appropriate if the LPDME catalyst system development can be completed successfully. Up to \$875,000 of CCT LPMEOH™ Project budget support, from the Cost Plan (22 October 1996), should be made available to support a suitable LPDME test run at LaPorte.
- An implementation decision, made mutually by the DOE's CCT (DE-FC22-92PC90543) LPMEOH™
 Project participants, and by the DOE's Liquid Fuels (DE-FC22-95PC93052) Program participants, should be made (by July of 1997) in time to implement testing at LaPorte in early 1998. (Final dates should be recommended by the DOE's Liquid Fuels Program, based on progress in developing the LPDME catalyst system). The CCT LPMEOH™ Project participants shall be kept informed (via review meetings and status reports) by Air Products of the development by the DOE Liquid Fuels Program participants of the LaPorte AFDU LPDME test-run plans, so that a timely final approval can be made
- In the interim, some DME product-use testing may be appropriate for the LPMEOHTM Demonstration Project's off-site product-use testing.

The schedule for the proposed LPDME testing at the LaPorte AFDU and possible implementation at the Kingsport LPMEOHTM Process Demonstration Facility is summarized below:

DME DVT Decision Made July 1997

Commercial-Scale DME Catalyst Produced/Tested

in Laboratory Autoclave January 1998

LaPorte AFDU Test February/March 1998

Kingsport Decision Made March/April 1998

Kingsport Implementation (Provisional) Plan July 1998 - March 2001

Impact on CCT Project

<u>Technical</u>: The commercialization of the LPDME Process can be successfully achieved by the combination of the activities at the LaPorte AFDU and the LPMEOH™ Process Demonstration Unit described previously.

Cost: Up to \$875,000 of Project funds would be available to support a suitable LPDME run. An update of the CCT Project's Cost Plan (22 October 1996), based upon the DVT Recommendation, will be performed following the joint Partnership/DOE decision.

Schedule: If the DVT Recommendation is approved by the Partnership and DOE, the operating schedule for the LPMEOH™ Process Demonstration Unit will remain unchanged from the current Demonstration Test Plan (September 1996). The DVT would proceed according to the September 1996 DME Milestone Plan (included in the Demonstration Test Plan) and the schedule of the Liquid Fuels Program.

Patricia Fry Godley JULY

Assistant Secretary for Fossil Energy

Subject

Approval of Request for Transition to the Final Budget Period Three for the Liquid Phase Methanol Process Demonstration Project Cooperative Agreement

No. DE-FC22-92PC90543

You are anthonized to transition from Budget Period Two (Design and Construction) to the final Budget Period Three (Commissioning, Startup, and Operation) on the demonstration project. "Commencial Demonstration of the Liquid Phase Methanol Process." Cooperative Agreement No. DE-PC22-92PC90543 in accordance with the Continuation Application Request of August 2, 1996, and supporting documentation. You are authorized to provide \$67,138,458 of funding as the Department of Energy's (DOE) share of the cost of the final Budget Pariod. The total estimated cost of the project remains at \$213,700,000 with a DOE cost share of \$92,708,370.

Background

The Partnership Agreement requires that an Annual Operating Plan be prepared each Fiscal Year for the approval of the Partners. Article 5.2 of the Partnership Agreement sets forth the requirements. This memo constitutes the Partnership's Annual Operating Plan for FY-'97.

Goals and Objectives for FY- '97

The goals and objectives for FY-'97 are to initiate Phase 3 operation of the LPMEOH™ demonstration plant in accordance with the Statement of Work. The Milestone Schedule (Attachment A), the Demonstration Test Plan (Attachment B), the FY-97 Cost Plan (Attachment C) and the Project Success Factors (Attachment D) are attached for reference. These attachments summarize the Phase 3, Operation activities, and the schedule for their performance. The Partnership's major FY-'97 objectives are:

• the LPMEOH[™] demonstration plant will have successfully completed Test Runs #1 through #5 (by May-'97), and will have achieved 30 plus weeks of Task 2.1.1 operation (by Sept-'97).

- the decision to continue DME design verification testing, at the LaPorte AFDU in conjunction with the DOE Alternative Fuels R & D program, will have been made (by Dec.'96); and plans will have been made (by Apr '97) for completion of the operational proof of concept testing at LaPorte by December of 1997.
- the updated plan for Off-site Product-use Testing will have been completed (by May '97).
- the project Success Factors will continue to have been achieved during FY-97.

DOE/Air Products/Eastman SUCCESS FACTORS LPMEOH™ DEMONSTRATION PROJECT

The three participants will judge the project success on the following factors:

- SAFE AND ENVIRONMENTALLY SOUND OPERATION
- DEMONSTRATE THE NEW TECHNOLOGY:
- RESOLVE ALL TECHNICAL ISSUES
- ACQUIRE SUFFICIENT ENGINEERING DATA FOR COMMERCIAL DESIGNS
- **OBTAIN INDUSTRY ACCEPTANCE**
- FOR EASTIMAN OPERATION AT KINGSPORT;
- NO ADVERSE IMPACT DURING DEMONSTRATION
- VALUABLE PLANT ASSET AT END
- MEET BUDGET AND SCHEDULE EXPECTATIONS
- POSITIVE WORKING RELATIONSHIPS BETWEEN THE PARTICIPANTS

APPENDIX H - TEST AUTHORIZATION #K1 - INITIAL SHAKEDOWN AND DESIGN PRODUCTION TESTS

TEST AUTHORIZATION # K1

Kingsport LPMEOH™ Plant

Sheet:

1 of 3

Date:

03/31/97

By:

VES

RUN NUMBER:

K1 (also incorporating K7)

APPROX. START DATE:

1 April, 1997

TITLE:

METHANOL SYNTHESIS WITH BASELINE CATALYST:

INITIAL SHAKEDOWN AND DESIGN PRODUCTION TESTS

OBJECTIVE:

To start-up the LPMEOH™ facility, test the design methanol production rate, and shakedown various systems critical to successful long-term operation of the plant.

SUMMARY:

After activation of the initial catalyst charge (approximately 20,000 lbs of catalyst oxide, or about 1/2 of the design catalyst loading in the reactor), the start-up of methanol operations will initiate a total system shakedown and test of the design methanol production rate of 260 TPD. This 6-week operating period prior to Eastman's complex outage will facilitate testing of systems which must operate on a continuous basis (e.g. recycle compression, carbonyl guard bed, reactor/steam system, oil collection and return, methanol collection and distillation, data acquisition, analytical, etc.). The process control strategy will be validated and tuned, and material balance calculations will be performed. During this test, catalyst activity will decrease slowly due to normal catalyst aging. Fresh Feed flowrates will be adjusted to maintain Syngas Utilization at its initial value.

TEST DETAILS:

See pages 2 to 3 for details.

ANALYTICAL COMMENTS:

See page 3.

SAFETY IMPLICATIONS:

Air Products personnel will be required to wear Nomex in the plant when syngas is present. Otherwise, Eastman safety rules (including M.O.C.) are in effect. All visitors to the facility must follow the Visitor Safety Guidelines issued by the Joint Venture.

ENVIRONMENTAL IMPLICATIONS:

Minimal. The plant syngas purge will go to the Eastman boilers as designed.

SPECIAL REMARKS:

Because of ongoing problems with the 29G-03 Oil Make-up Pumps, which provide high pressure seal flush to the 29G-01 Condensed Oil Circulation Pumps and batch make-up oil into the reactor loop, Test #K1 will also incorporate Test #K7. The objective of Test #K7 is to test the capability of the system to free-drain condensed and entrained oil/catalyst from the 29C-06 Cyclone and 29C-05 Secondary Oil K.O. Separator back to the reactor. During this period the 29G-30 Slurry Transfer Pump will provide make-up oil to the process in batches as necessary. It requires only low pressure packing flush oil, which the 29G-03 can provide.

AUTHORIZATIONS:

E. C. Heydorn - Program Manager

V. F. Stein - Lead Process Engineer

TEST AUTHORIZATION # K1

Kingsport LPMEOH™ Plant

Sheet:

2 of 3

Date : By: 03/31/97 VES

TEST DETAILS:

1. Set up N2 purges to the vent header at 100 SCFH on each of the rotameters by the 29E-01 (FI-1970) and 29C-02 (FI-1115).

- 2. Follow the Reactor Area Start-Up Procedure S.O.P. Section II A 3. After the start-up preparation steps (A-C), continue with Step D.
 - D. Charge fresh oil from 29D-30 to 29C-05 secondary oil K.O. vessel and 29C-06 cyclone.
 - E. Place 29K-01 syngas recycle compressor in service.
 - F. Transfer reduced catalyst slurry from 29D-02 slurry tank to the reactor (via 29G-02) per Section IV A 9 Steps K, L, M, and N. The slurry temperature must not exceed ambient temperature by more than 165 °C.
 - G. Start N2 Flow from 29K-01 to reactor.
 - H. Start BFW to 29C-02 steam drum and reactor tubes.
 - 1. Start CW flow to 29E-04 MeOH product CW condenser.
 - J. Start fans on 29E-03 MeOH product air-cooled condenser.
 - K. Heat reactor to 204 °C at <30 °C/hr. Initially BFW / steam temperature should not exceed slurry temperature by more than 150 °C. Once the slurry temperature exceeds 125 °C, BFW / steam temperature should not exceed slurry temperature by more than 40 °C.
- 3. Because condensed and entrained oil/catalyst will free-drain back to the reactor, omit Steps L-O. Instead, ensure that automatic valves HV-184 and HV-185 are both shut.
- 4. Continue with Step P.
 - P. Start fresh feed syngas to plant.
 - Q. Establish level control for 29C-03 high pressure MeOH separator.
- 5. At Step R, raise the reactor pressure (PIC-150) and temperature (TIC-109) to the design operating conditions: 735 psig and 250 °C. Set the syngas flow rate (FIC-009) at 990 KSCFH, and skip Steps S and T until Plant 19 lines out at reduced rates and the H2 Makeup composition reaches its new steady state. Eventually, new feed setpoints will be calculated for the CO and H2 Makeup streams. Then, FIC-009 will be reduced by that combined flow rate to maintain total fresh feed at 990 KSCFH. Set the compressor flow (FIC-008) at 1,760 KSCFH.
- 6. During the first 24 hours, the syngas conversion across the reactor may decrease as the catalyst loses its initial hyperactivity. As a result, the purge flow (FI-157) may increase. Eventually, the purge rate should be about 160 KSCFH.
- 7. To free-drain condensed and entrained oil/catalyst from 29C-05 and 29C-06 to the reactor, open HV-185 and the necessary manual valves. Monitor levels in the 29C-05 (LI-102) and 29C-06 (LI-152), as well as the reactor NDG.

TEST AUTHORIZATION # K1

Kingsport LPMEOH™ Plant

Sheet:

3 of 3 03/31/97

By:

VES

- 8. Until the 29G-03 pumps are repaired, oil will be batch transferred into the system as needed by the 29G-30 pump per S.O.P. Section II C 3 Step P.
- 9. The shakedown period will likely conclude with the Eastman complex outage in mid-May. In that event, purge, cool, and drain the reactor system according to the Reactor Area Extended Shutdown Procedure (S.O.P. Section II A 8).

TEST AUTHORIZATION #K1 is complete.

ANALYTICAL REQUIREMENTS:

- 1. Process GC sampling requirements:
 - SP-1: syngas feed;
 - SP-4: K-01 outlet;
 - SP-5: reactor feed (highest frequency);
 - SP-6: C-05 outlet (highest frequency);
 - SP-7: main purge;
 - SP-8: distillation purge;
 - SP-2 and SP-3 can remain valved out until required.
- 2. Carbonyl GC sampling requirements:
 - SP-12: 29C-40 guard bed inlet;
 - SP-13: 29C-40 guard bed intermediate #1;
 - SP-14: 29C-40 guard bed intermediate #2;
 - SP-15: 29C-40 guard bed outlet.
- 3. Liquid sampling requirements:
 - all identified liquid sampling points per standard Eastman routine.
