NAVY DEPARTMENT

BUREAU OF SHIPS
WASHINGTON 25, D. C.

8 November 1945

Subj: Microfilm of German Technical Documents -
Introductory Statement for.

1. During the course of its field trips to examine German synthetic oil plants and to interrogate German technical personnel, the members of the Oil Team of the U. S. Naval Technical Mission in Europe obtained a number of technical documents for examination. Some of these documents were directly related to certain subjects in which immediate reports were desired and were incorporated in Technical Reports as microfilm appendices. Other documents, while probably of equal technical value, were, due to limitations of time and translation facilities, saved for more detail study and examination. These latter documents have been indexed and microfilmed by the Bureau of Ships to preserve the technical information therein for future use and to make possible the dissemination necessary to give each activity an opportunity to study the particular topics of interest to it.

2. The documents shown in this series of reels have been grouped as follows:

PART NO.	TITLE
1	Synthetic Lube Oils; Esters
2	Inhibitors; Crude Oil Data; Aviation Gasoline I
3	Aviation Gasoline II
4	Aviation Gasoline III
5	Diesel Oil, Fuel Production and Tests
6	Technical Data
7	Methanol and Isobutyl Oil Synthesis
8	Gas Production
9	Aviation Gasoline IV

FROM BUREAU OF SHIPS, NAVY DEPARTMENT, WASHINGTON 25, D. C.

Subj: Microfilm of German Technical Documents -
Introductory Statement for.

PART NO. TITLE (cont'd)
10 Oxygen Plant
11 Phenol Extraction; Miscellaneous
12 Catalyst Preparation and Regeneration
13 Flow Diagrams of Various Processes
and Miscellaneous Data
14 Miscellaneous Flow Sheets

A complete index by parts is shown at the beginning of the series of microfilm reels, and each part is preceded by its own index. Pages have been numbered serially, those included in each part being shown on the first page of the appropriate part index. The contents of this series of film reels are not to be taken as a complete record of all the information obtained on any subject.

3. The Bureau of Ships Research Branch would appreciate receiving a copy of any translations that may be made of these data in order to complete its technical files.

T. A. Solberg
T. A. Solberg
By direction of
Chief of Bureau

PART No. 1

SYNTHETIC LUBRICATING OILS - ESTERS

Doc.
No.

- 1 Photostat of flow sheet #50550 of 1941: "Sketch of synthetic oil installation" by the Ethylene process.
- 2 Blueprint of Drawing M10752-2 of December 1942, Leuna, flow sheet "Sketch of cracking and separation plant" for the preparation of 6000 tons per year of ethylene out of 8200 tons per year of ethane.
- 3 Blueprint of drawing M2526-1 of September 1938, flow sheet of acetylene hydrogenation process.
- 4 Blueprint of drawing M3619-1 of August 1940, Leuna, Sketch of the P₃ plant in Building No 981 - showing treatment of the sump phase.
- 5 Blueprint of drawing M10274-2, Leuna 1942 - flow sheet of the ester oil plant of building No 1016 for four different types of esters.
- 6 Blueprint of drawing M3295-1 of 1940 - flow sheet of the formaldehyde and propionaldehyde preparation of the P₃ charge - 10 charges per day.
- 7 Blueprint of drawing without number, of 1938 - flow sheet of Synthetic lube oil plant from ethane C₂H₆ and methane, through ethylene C₂H₄.
- 8 Blueprint of drawing M6015-1 of December 1945, Leuna - flow sheet of lube oil treatment.
- 9 Blueprint of drawing M3184-1 for Building No-981, Leuna 1942 - Sketch of the T-plant, starting with adipic acid and benzol sulfgas.
- 10 Blueprint of drawing M4580d-1 of October 1941, Leuna - flow sheet titled "Sketch of the E-oil plant No 981, 2000 tons per year."
- 11 Blueprint of drawing M5445-1 of October 1942, showing flow diagram and location of measuring instruments for the E-oil plant.
- 12 Blueprint of drawing 5546-1 of 1942, flow diagram of oil plant in Building No 126.
- 13 Blueprint of drawing M4407-1 of July 1941, flow diagram of the E-oil plant, 200 tons per month, showing esterification, washing, distillation, and blending of lube oil.

- Doc. No.
- 14 Blueprint of drawing M6017-1 of December 1943, Building Me 955, Leuna - "Sketch of thermal cracking plant" - flow sheet of the ethylene - lube oil process with list of detail drawings.
- 15 Blueprint of drawing M6013-1 of December 1943, Building Me 124. "Sketch of the mix-polymerization plant Me 124" for the preparation of lube oils - flow sheet.
- 16 Blueprint of drawing M7564-2, 1940 - Paraffin plant, Building Me 458 - 2 tons per month.
- 17 Blueprint of drawing M3952-1 of 1941. Sketch of the M4 Plant, Building Me 924 for polymerization - Location of measuring instruments.
- 18 Blueprint of drawing M5607-4 - Cracking tests - Sketch of middle oil cooling in the gas phase - Building M 499.
- 19 Blueprint of drawing M10468-2 of 1942. E-oil plant - preparation of Ester 515, Building Me 1016.
- 20 Blueprint of drawing M10466-2 of 1942. E-oil plant - preparation of Ester 623, Building Me 1016.
- 21 Blueprint of drawing M10467-2 of 1942. E-oil plant - preparation of Ester 426, Building Me 1016 - with a typewritten note by Fischer on Esters 504 - 515 - 623 and 426, dated 19 October 1942.
- 22 Blueprint of drawing M10469-2 of 1942. E-oil plant - preparation of Ester 504, Building Me 1016.
- 23 Blueprint of drawing M2645-1 - general flow sheet of the polymerization process in Building Me 126.
- 24 Blueprint of drawing M5969-1, Leuna, November 1945. Building Me 942 - "Flow sheet of the Linde plant" for the synthetic oil preparation - flows of CH_4 , C_2H_4 and C_2H_6 and list of detail drawings.
- 25 Blueprint of drawing M5958-1, Leuna, October 1945. Building Me 942 - "Flow sheet of the cracked gas washing plant" for the preparation of synthetic oil 900 - with list of detail drawings.
- 26 Blueprint of drawing M5035-2, Leuna, of 1938. Building Me 944 - "Flow sheet of paraffin removal plant."
- 27 Blueprint of drawing M9012-4, Leuna, 1945. Building Me 498 - Sketch of the Polymerization plant for a pressure of 25 atm.
- 28 Blueprint of drawing M2854-1, Leuna 1939. General sketch of the propane plant and paraffin removal - showing safety features, in Building Me 944.

INHIBITORS; CRUDE OIL DATA;
AVIATION GASOLINE I
PART ONE - INHIBITOR PLANT

30108

Doc.
No.

- 1 A folder of calculations, charts and data from the I.G. Farbenindustrie A.G. dated 25 November 1942 at Leuna, about the proposed inhibitor plant of a capacity of 3.2 tons per month. Sketch 924103 is attached. The following are detached but part of the report:
- 2 Blueprint of Sketch 45 dated February 1943 - flow sheet of plant.
- 3 Blueprint of drawing M-11568-2 July 1943. Flow sheet of inhibitor plant for 3.2 tons per month, in 3 loads per month.
- 4 Ditto - revised M-11568-C-2.
- 5 Blueprint of drawing M-5382-1 October 1943. Piping flow sheet for Building Me 1016-M with list of detail drawings of equipment.
- 6 Blueprint of drawing M-5585-1 of July 1943 - Leuna - Building and location of apparatus for inhibitor plant Me 1016-M.

PART TWO - DATA ON EUROPEAN OILS

(all dated at Leuna, October 1942.)

- 7 Russian crude oil data on the 1939 Russian oil situation, quantities and specifications of various products from the various Russian fields.
- 8 Data on the conquered Maikop oil field.
- 9 Possible yield of crude oil in the Ural-Volga fields.
- 10 Notes on Hungarian crude oil.
- 11 Analyses of crude oil and byproducts of six various German fields: Heide, Neusiede, Pechelbrom, Fisterdorf, Nienhagen, and Reitbrook.
- 12 Blueprint of drawing N-3757-2 I.G. Ludwigshafen of 1936 - Flow diagram of the oil hydrogenation plant of the A.N.I.C. (Italian) with Albanian Pacura Oil.

PART THREE - AVIATION GASOLINE

- 13 Report No. 863 of the I.G. Farbenindustrie A.G. Leuna, February 1943 by Dr. Wals "The hydroforming process," for aviation gasoline, 46 pages of text, 25 curves, 43 tabulations, and blueprint of drawings M-3392-3 of plant I at low temperature and plant II at high temperature.

METHANOL AND ISOBUTYL OIL SYNTHESIS

Doc.
No.

- 1 An 11-page bibliography on the subject of methanol and other high molecule alcohols from CO and H₂O, from the Leuna Library - 1943.
- 2 A calculation sheet and 2 curve sheets on the reaction $2CO + 4H_2 \rightarrow C_2H_4 + 2H_2O$, Leuna - 1942.
- 3 Data (typewritten) on the history of methanol synthesis in Germany and other countries with a list of patents of Dr. M. Pier since 1923 - 9 sheets.
- 4 Blueprint of drawing M-9239-2 - 1941 - Sketch of the CO₂ and water pressure washing for the Synol plant at Leuna.
- 5 Blueprint of drawing M-4798-16 - Sketch of the OXO process (no date).
- 6 Blueprint of drawing M-5458-16 of 1940 - Sketch of the OXO-test plant - Leuna (2 copies).
- 7 Blueprint of drawing M-8929-4 of March 1945 - Leuna - Sketch of the Ether Removal from Isobutyl of column IIIA in Building Me 417.
- 8 Blueprint of drawing M6108-2 of June 1939 - Leuna - Distillation plant in Building Me 490 - Isobutyl distillation columns #2 to 7.
- 9 Blueprint of drawing M5438-4 of October 1939 Leuna - Sketch of the preparation of pure methanol.
- 10 Blueprint of drawing M-1682-1 of 1937 - Leuna - Sketch for the preparation of isobutyl to iso-octane.
- 11 Blueprint of drawing M4799-1 - Leuna February 1942 - Flow sheet of the preparation of synol byproducts in Building Me 458 with list of detail drawings.
- 12 Letter-size photostat, undated - flow sheet of the cycle operation in the methanol and isobutyl oil plant.
- 13 Letter-size flow sheet of the isobutyl preparation in 1940 - Columns 1 to 7 in Building Me 490 and Columns 5 to 7 in Building Me 417.
- 14 Letter-size photostat - flow sheet of methanol and isobutyl recovery in Leuna 1939 - #45591.
- 15 Letter-size photostat of preparation of pure methanol in Building Me 982 - Leuna - undated.
- 16 Plan view of Building Me 982 at 1:500 scale.
- 17 Letter-size sketch of September 1940 flow sheet for methanol.

- 18 Blueprint of letter-size sketch O/996. Project for the construction of an oil pressure vent on the methanol and isobutylol chambers in Me 355.
- 19 Photostat of letter-size sketch O/1421 undated, 1450 m/m fractionating column (50 trays) for the separation of dimethylether and light olefins from the raw isobutylol.
- 20 Photostat of letter-size sketch O/1014 undated, "Separation of the methanol from the higher molecular water soluble alcohols."
- 21 Blueprint of drawing O.A. SK2 of July 1942 - New Process for the preparation of pure methanol from raw methanol containing ether - flow diagram.
- 22 Blueprint of drawing M2749-S - Leuna December 1939 - Sketch for the reaction of methanol and carbon monoxide.
- 23 Blueprint of drawing M-5539-S of March 1941 - Leuna - Sketch of a pure methanol distillation plant for 22.9 tons per day, for Japan, Niton Koggo.
- 24 Blueprint of a sketch, November 1939 for the production of 50,000 tons per year of air gas and 50,000 tons per year of tanol.
- 25 Blueprint of drawing M5571-S of April 1941 - Leuna - Sketch of a pure methanol distillation plant, a batch proposition, for Niton Koggo.
- 26 Blueprint of drawing M2450-S of March 1939 - Balance sheet for the production of 50,000 yearly tons of iso-octane and 35,000 yearly tons of gasoline, from mixture of CO + 2H₂.
- 27 Blueprint of letter-size sketch of 1939, Indwighshafen - on the Butyl synthesis.
- 28 Blueprint of letter-size sketches of 1939 on air gas production, Sketch # III.
- 29 Ditto - Sketch # IV.
- 30 Ditto - Sketch # VI.
- 31 Ditto - Sketch # VII.
- 32 Blueprint of drawing M3675-S of May 1941 - Leuna - Sketch of the distillation of fuels from the middle-pressure synthetic plant - "Auschwitz Gasoline" 75,000 yearly tons of gasoline, 7,500 yearly tons of gas oil.
- 33 Blueprint of drawing 16159 of the Degussa, January 1944 - layout of the testing installation for methanol at Wolfgang.

PART NO. 8
GAS - PRODUCTION

30776

Doc.
No.

1. A 6-page mimeographed note of instructions dated at Böhlen on 5 January 1945 titled: "Measures of Protection against Freezing Damage in case of Complete Stillstand of the Gas Works."
2. A 22-page booklet dated Oppau March 1940 on "Cost Comparison for 2 Types of Synthesis Gases, from Coke or from Water Gas."
3. The pressure gasification of solid fuels with oxygen by Dr. F. Danulat - reprint from article in "Gas und Wasserfach" 1941.
4. Same article as (3) in English (illustrated).
5. A similar article in German by same author.
6. Lurgi pamphlet on "High-Pressure Gasification Installation."
7. Reprint of an article in "Oel und Kohle" of 1942 by Dr. A. Rettemaier on "Present Status of the Development of Total Gasification" describing the Bubiag-Didier process, Kappers process, Pintsch-Hildebrand process, Schmalfeldt-Wintershall process, Winkler process, Lurgi High-Pressure process, Thyssen-Galocsy process, Demag process, Ruhrgas process.
8. Three pages of typewritten text and 5 photostats of pictures for Patent Application #OZ 12196 concerning the "Tulip-type Grate" for gas generators.
9. Tracing of drawing 2105-2 from "Mineröl-Baugesell" of March 1937 - for the Brinker layout connected with the Winkler generator.
10. Letter-size blueprint of a sketch of the high-pressure gasifier of the A.S.W. dated 1941 showing relations of the 3-main parts.
11. Blueprint of drawing 487-1 of Braunkohle Benzin of 1935 showing complete assembly of the Winkler generator, location of all valves and all measuring instruments.
12. Blueprint of drawing F.A. 1052-2 of Theisen GnCH. of 1940 showing the Theisen gas washer.
13. Colored blueprint of drawing ATL 9547-1 of Friedrich Uhde, Dortmund of 1942 showing the piping layout #II - Propane separation, redistillation and stabilization.
14. Blueprint of drawing 3-A-56153 of BAMAG-MEQUIN May 1935 - Tower cleaning plant for water gas, capacity 700,000 m³ per day for BRABAG, Böhlen.

- 36 Blueprint of sketch BSK 17 Leuna 1942 - Balance sheet of alkylation with chlorine dehydrogenation, M-C-process, capacity 48,900-tons-per-year input.
- 37 Blueprint of drawing M9911-4 Leuna 1944 - Balance sheet for alkylation plant with addition of Fischer gas fuel.
- 38 Blueprint of drawing M-8622-4 Leuna 1942 - Balance sheet for alkylation plant without butylene stabilisation.
- 39 Blueprint of sketch O/909/a Leuna 1940 - Comparison of alkylation with isomerization and T52 process.
- 40 Blueprint of sketch M4151-16 of F. Uhde Leuna 1941 - Sketch of the alkylation process.
- 41 Blueprint of M3893-16 undated, by F. Uhde - Sketch of the alkylation process.
- 42 Blueprint of sketch O/1011 of 1940 Leuna - the cracking of the tri-polymers in Building Me 493.
- 43 Blueprint of sketch without number - Leuna 1942 - n-Butane dehydrogenation with chlorine - 1 ton/hour of Butane.
- The six following blueprints of letter-size sketches prepared in Leuna in 1942-45 are balance sheets to compare several alkylation processes, as follows:
- 44 BSK35a - Chlorine dehydrogenation, Bähr process without isomerization - input 47,500 tons per year C4.

1ST PART - PHENOL EXTRACTION

Doc.
No.

- 1 Photostat on cloth of the hydrogenation plant at Leuna as of 15 December 1940 showing location of buildings, piping, valves, and measuring instruments.
- 2 Blueprint of drawing M10750-2 Leuna 1942 - Sketch of the Tank farm pumps and pipings at Leuna, particularly covering materials to be shipped to Brux and Fölitz.
- 3 A group of 3 blueprints of sketches on Phenol Extraction:
BSK-80 for 3000 tons input per month for pure phenol
BSK-81 for 5000 tons input per month for pure phenol
BSK-82 for 5000 tons input per month for raw phenol
- 4 Blueprint of drawing M5924-1 Leuna 1941 - Sketch of the Phenol extraction plant.
- 5 Blueprint of drawing M5989-8 Leuna 1941 - Sketch of the Nitrogen safety lines for the phenol extraction plant.

2ND PART - MISCELLANEOUS

- 6 Tracing of drawing 2030-2, 1937, of BRABAG Pilot plan of the Feitz plant attached to code plan.
- 7 A mimeographed two-page note and two drawings showing pressure-resisting mountings for thermoelements.
- 8 A report by G. CAMPEN of Rheinpreussen dated May 1941 titled: "On the concentration of olefines in Fischer-Tropsch synthetic gasolines" - 17 pages of text, 14 diagrams.
- 9 A report by Göschel of I.G. Farbenindustrie Leuna of 22 February 1937 titled: "Influence of the size of catalyst pellets on the surface of contact, the resistance to flow and the output in the #800 isobutyl oven." 9 pages of text and 15 curves.
- 10 Report of 17 November 1939 titled: "Preparation of the esters of iso-propylalcohol, secondary-butylalcohol and amyl-alcohol, with acetic, propionic and butyric acids." 9 pages of text, 21 figures and 1 tabulation.
- 11 One folder containing letter-size graphs for the calculation of costs, prepared by the I.G. Farbenindustrie AG Leuna in 1943. These graphs cover the following equipment:
Steam turbines up to 1500 KW
Various metal vessels for pressures up to 30 atm.
Slide valves
Ceramic circulating pumps

Circulating pumps for acids and special products
Normal circulating pumps including motors
Electric motors - up to 1500 KW at 1500 RPM
Electric motors - up to 250 KW at 3000 RPM
Flywheel motors including switch and coupling
Weight of copper and steel in motors up to 1500 KW
Circulating fans up to 25000 m³ per hour with 1, 2, or 3 stages
Turbo-ventilators up to 30000 m³ per hour and up to 8 stages
Hot gas ventilators up to 80000 m³ per hour
Gasometers with waterseals up to 80000 m³
Special gasometers up to 1500 m³ capacity
Piston compressors with drive
Turbo-compressors up to 60000 m³ per hour, compression ratio up to 6:1
Relation between weights and costs of ammonia compressors in connection
with vaporizing temperature, at constant capacity
Weights and costs of tray fractionating columns
Weights and costs of full-body columns
Vertical firewalls around storage tanks
Cost of measuring instruments for a distillation column

The following four reports deal with heat transfer and were prepared on the occasion of the Heat convention at Oppau:

- 12 A report of 17 pages and 2 charts, all typed on tracing paper for reproduction dated April 1944 Leuna, titled: "Cases of special economical application of thermopumps in the chemical industry."
- 13 A report of 20 pages, 5 diagrams, and 3 tabulations by Keinke of I.G. Farben Leuna dated January 1944, no title, on special heating processes in connection with the new installation at Leuna, such as:
 - high-pressure steam
 - direct gas heating
 - diphenyl boiler, gas heated
 - compression of steam from 16 atm. up to 25 atm.
 - electrical heating
 - use of the superheat of 16 atm. steam expanded into the low-pressure system
- 14 Notes on heat transfer, photostated, dated 21 August 1942 - 6 pages of calculations and 4 pages of diagrams.
- 15 A 12-page multicopied report by Keinke, dated 1942 - Leuna - titled: "A simple method for the determination of radiation of the walls of heated containers."
- 16 Blueprint of drawing M8469-2 dated 1941 - Sketch of the acetic acid synthesis.
- 17 Blueprint of sketch BSK 67, dated 1943 Leuna - Aviation gasoline plant (AROBIN = aerobenzin).

FLOW DIAGRAMS OF VARIOUS PROCESSES
AND MISCELLANEOUS DATA

Doc.
No.

- 1 A 153-page mimeographed volume describing patents concerning fifteen various subjects related to the chemical industry, from about 225 companies and individuals from all over the world. Patents cited go as late as 1939. Book must have been prepared around 1940. The work is chiefly concerned with ammonium sulfate production, recovery, treatment, crystallization, etc.
- 2 Blueprint of drawing M-5569-1 Leuna 1940 - flow diagram of the K.W.Sy experimental unit, showing two stages of synthesis ovens, production of gasoline and gasoil, product going to OEOplant. This is probably a synol synthesis process.
- 3 Blueprint of drawing M10861-2, unidentified, undated - sketch of the proposed ammonia-water treatment plant.
- 4 Blueprint of drawing M-9804-2 Leuna 1942 - diagram of a plant in Me 994 for the production of pyrocatechin with location of 20 pieces of equipment and indication of detail drawings.
- 5 Blueprint of M-6082-2 Leuna 1942 - new construction in Building Me 267. Diagram of the oven group and the absorption plant for the production of 25 tons per day of Nitrogen in NH₃, with list of equipment, supplies, and drawing numbers.
- 6 Blueprint of drawing M-3647-1 Leuna 1940 - flow diagram of a process, unidentified, which seems to be preparation of aldehydes.
- 7 Blueprint of drawing M-1857-1 Leuna 1937 - Block diagram of the preparation of ammonium phosphate with calcium phosphate and carbonate residues.
- 8 Blueprint of drawing O.A.SKI Leuna 1942 - Present method for the preparation of pure methanol from raw methanol containing ether - flow diagrams.
- 9 Blueprint of drawing M-4733-1 Leuna 1941 - Cyclohexanol plant in Building Me 978 - diagram for the monthly production of 1550 tons of cyclohexanol showing 30 pieces of equipment, flow diagrams, sizes, capacities, and detail drawing numbers, and location of measuring instruments.
- 10 Blueprint of drawing M4687-1, 1941 - Sketch of the Mersol plant at Moosbierbaum (synthetic soap) showing extraction, hydrogenation, acid wash, sulfochlorination, HCl absorption, saponification and dechlorination of the residue oil.
- 11 Blueprint of drawing M10811-2 Leuna 1942 - Sketch of the H₂S preparation in Building Me 386 and treatment of the ammonia water as of 18 December 1942.
- 12 Blueprint of drawing M2908-1 Leuna 1934 - Sketch of the sulfo-chloride plant in Building Me 947 including saponification giving description of 20 pieces of equipment.

- 13 Blueprint of drawing M-5396-1 Leuna 1945 - Carbondioxyde plant in Building Me 9241 - Sketch showing flow diagram, equipment, measuring instruments, piping, detail drawing numbers, for a monthly production of 550 tons of CO₂.
- 14 Blueprint of drawing M-3502-1 Leuna 1940 - flow sheet for the preparation of LURAN in Building Me 979. This sketch is intended to be colored, is therefore quite difficult to follow without the colors.
- 15 A 2-page report of 31 May 1943, Leuna, reporting a test of a combination of silicon tetrachloride and ammonia for production of smokescreens with 7 photographs, also 1 dozen of photographs related to smokescreen production. Results were negative.
- 16 Report #441 of I.G. Farben Leuna dated February 1944 by Dr. Geib: "Theory of the formation of formaldehyde by catalytic oxydation of methans with ozons and oxygen" - 7 pages.
- 17 Four typewritten sheets of calculation, and blueprint of sketch BSK 64 attached, dated Leuna April 1943 - on the preparation of a solution of SO₂ HCl + SO₂ called N-solution for 10 tons per day - process can be followed on flow sheet.
- 18 Blueprint of sketch BSK 64a of Leuna showing flow sheet of production of 10 tons of N-solution per day - somewhat different from BSK 64 attached to document 17. This sketch gives quantities per hour. Five sheets of analyses are attached, for sulfochloric acid oxygen, sulfur dioxide, rhomboid sulfur, and sulfur trioxide.
- 19 Blueprint of drawing M5334-1 Leuna 1943 - flow sheet for the preparation of methyl adipic acid in Building Me 1018 describing 51 pieces of equipment with capacities.
- 20 Blueprint of drawing M1695-8 Leuna 1938 - Sketch of the second hydrogenation for Chamber #7 in Building Me 15.
- 21 Photostat of drawing BSK 53 Leuna 1943, showing diagram of the plant for LEUTOL II Production of 1000 Kg per hour of pure Toluol.
- 22 Blueprint of drawing M4807-1 Leuna 1942 - Flow diagram of the preparation of 50,000 tons per year of Mersolat (synthetic soap). Saponification with NaOH at 5% and Mersol H.
- 23 Blueprint of drawing M2670-1 Leuna 1939 - Flow sheet for the production of acetone from propylene, capacity of 2000 tons per year of acetone.
- 24 Blueprint of drawing M-1501-1 Leuna 1936 - Flow sheet of the regeneration of catalyst, the nitrate plant and the mercury separation, for the acetic aldehyde plant.
- 25 Blueprint of letter-size drawing M4025-16 Leuna 1941 - Block diagram of the synol plant for 10000 tons per year.

Leuna-Werke, den 19.10.42 Kz.

Besprechungsbericht.

Ort der Besprechung: Leuna-Werke, Me 963
 Tag der Besprechung: 17.10./19.10.1942
 Anwesend: Herr Dr. Metzger
 Herr Dr. Jagemann
 Herr DI. Grüttner
 Herr Dr. Fischer

Gegenstand der Besprechung: Die Schematas Zeichnungs-Nr. M
 10466-69-2 für die Ester (623, 426,
 515 u. 504) wurden durchgesprochen
 und folgende Änderungen festgelegt.

Ester 504:

Es besteht noch Unklarheit darüber, ob die Methyladipinsäure (Schmelzpunkt 75°) kristallinisch oder in halbfestem Zustand angeliefert wird. Im ersteren Falle wird das Produkt auf der 21,5 m Bühne in einem Schmelzbehälter eingeschmolzen. Wird sie aber als unreine Säure, wie dem augenblicklichen Stand der Entwicklung entspricht, im Kesselwagen angeliefert, so müßte sie in dem im Keller stehenden 25 m³ Behälter flüssig bei 60° gelagert werden. Dieser ist evtl. mit einem Umlaufvorwärmer vorzusehen.

An dem Veresterungsrührwerk ist ein genügend großer bequem zu öffnender und schließender Eintragstutzen für die Naphthalinsulfur-Säure vorzusehen.

Die Rohrschlangen in den Waschrührwerken sind für Heizung und Kühlung vorzusehen. Über jedes obere Waschrührwerk ist ein etwa 200 Ltr. fassender Natronlauge-Behälter mit sichtbarer Standanzeige anzubringen, der von einem Vorratsbehälter von der 21,5 m Bühne (1-2 m³) gefüllt werden kann. Die Verteilungsleitungen, die von den Zentrifugen kommen, sind für Waschrührwerk 1, 2 und den Estertank getrennt zu verlegen, wobei die Ventilgruppe an der Zentrifuge zu bedienen ist. Die Pumpen, die den gewaschenen Ester aus den Rührwerken zu den Zentrifugen drücken, müssen sowohl an den Pumpen selbst, wie auch an den Zentrifugen ein und ausschaltbar sein. Die Bedienung ist vorläufig so gedacht, daß 1 Mann verestern und 1 Mann zentrifugieren soll. Als Anfallbehälter für gewaschenen Ester werden 2 von 30 m³ Behälter verlangt, damit bestimmt 4 Chargen hineingehen. Es wird vorgeschlagen, gestützt auf die guten Bitterfelder Erfahrungen, die Frage der Verwendung auf 100 m³ Holzbehältern für die Abwasserstation mit dem Konstruktionsbüro durchzusprechen. Der Überlauf-Steinzeugbehälter entfällt, stattdessen werden beide Ansäuerbehälter mit einer Ausgleichleitung verbunden. Die untere Leitung, die auch als Ausgleichleitung dient, erhält zwei Bullaugen und 1 Abfluß nach dem Neutralisierbehälter. Zum Umrühren der Abwasser wird ein Preßluftgebläse für 1 atü aufgestellt. Die gesamte Abwasserstation ist an eine A-Kohle-Anlage angeschlossen.

Bezüglich der Destillation soll zusammen mit dem Konstruktionsbüro über eine Siemens-Regel-Anlage gesprochen werden. Der Dünnschichtverdampfer wird mit einer direkten Einführung von 3 atü Niederdruckdampf versehen. Er selbst wird mit 45 atü Hochdruckdampf beheizt. In der Ablaufleitung des Sumpfes wird ein Quarzglasbullaue vorgesehen.

Desgleichen wird in der Destillatleitung ein Quarzglasbullaue und ein Destillatkühler in derselben Weise vorgesehen. Das Vakuum wird an den Abfallbehälter hinter dem Solekühler angeschlossen. Das dahinter befindliche Anfallgefäß wird als Trenngefäß für Wasser und Öl ausgeführt. Statt der Tauchung wird die Destillation durch ein Sicherheitsventil abgesichert. Die in der Destillatleitung und in der Sumpfleitung befindlichen Zwischenbehälter stehen 14 m unter der Destillation und bleiben offen. Für Bleicherde und Kalk soll eine pneumatische Eintragsvorrichtung vorgesehen werden.

Ester 515:

Es gelten die gleichen Änderungen wie bei Ester 504.

Ester 623:

Statt Pentaglykol wird in Zukunft P_2 (375kg je Charge) verwendet. Das P_2 wird in einem Anmischbehälter mit 0,7 bis 1,0 m³ Waschöl je Charge an-gemischt und mit einer Pumpe in das Esterrührwerk gedrückt, die je-weils nach dem Eintragen mit etwas Waschöl durchgespült wird. Der in der Wasseraufbereitung anfallende Halbester von den Ester 504, 515 u. 623 werden in einem 15 m³ Behälter gelagert, der 10 Tage ausreicht. Nach dieser Zeit wird der Halbester in der Waschanlage des Esters 623 mineral säurefrei gewaschen und mit neuem P_2 verestert. In der Ablaufleitung von den Waschrührwerken ist ein auswechselbares Sicher-heitspaßstück eingebaut. Für die Destillation u. Abwasseraufbereitung gilt dasselbe wie bei Ester 504.

Ester 426:

Es gelten sinngemäß alle Änderungen, die auch für Ester 504 gelten. Für die Seifenfettsäure wird eine eigene Einfülleitung nach dem Ver-esterungsrührwerk vorgesehen.
