NTIS

Providing Permanent, Easy Access to U.S. Government Information

National Technical Information Service is the nation's largest repository and disseminator of government-initiated scientific, technical, engineering, and related business information. The NTIS collection includes almost 3,000,000 information products in a variety of formats: electronic download, online access, CD-ROM, magnetic tape, diskette, multimedia, microfiche and paper.

Search the NTIS Database from 1990 forward

NTIS has upgraded its bibliographic database system and has made all entries since 1990 searchable on **www.ntis.gov**. You now have access to information on more than 600,000 government research information products from this web site.

Link to Full Text Documents at Government Web Sites

Because many Government agencies have their most recent reports available on their own web site, we have added links directly to these reports. When available, you will see a link on the right side of the bibliographic screen.

Download Publications (1997 - Present)

NTIS can now provides the full text of reports as downloadable PDF files. This means that when an agency stops maintaining a report on the web, NTIS will offer a downloadable version. There is a nominal fee for each download for most publications.

ABSTRACT

The rate of CO consumption in a slurry reactor containing a 5% ruthenium on alumina catalyst has been measured at temperatures between 200 and 280°C, pressures from 5 to 12 atmospheres, H₂/CO ratios from 0.4 to 5.0, and superficial gas velocities from 1.8 to 5.2 cm/sec. With this catalyst a Schulz-Flory distribution is not observed.

Variations in the rate with temperature and velocity indicate that mass transfer has only a small influence of the rate of reaction at 280°C. From these results, we estimate that $k_L a$ is approximately 0.19 s⁻¹ at a superficial gas velocity of 1.9 cm/sec.

Experiments aimed at determining the extent to which mass transfer influences the performance of Fischer-Tropsch slurry reactors have been carried out using a 5 wt% Ru/Al₂O₃ catalyst. CO conversion was measured as a function of H₂ and CO partial pressures, temperature and gas volumetric flow rate.

Figure 1a shows the rate of product formation as a function of carbon number at 200°C, when P_{H₂} is 5 atm. and P_{CO} is 7 atm. Figure 1b shows the same plot when P_{H₂} is 1 atm and P_{CO} is 5 atm. The expected straight line with y-intercept at R_{C_n}/R_{C₁} = 1.0 is not observed in either case. While straight line behavior is observed for high molecular weight products, the intercept is less than unity and the rates of formation of products containing between 2 and 4 carbon atoms sometimes fall below the line. Note that the intercept moves closer to unity as the H₂/CO ratio decreases. In addition, the deviation of lower molecular weight products from the straight line becomes larger as the H₂/CO ratio decreases. Figures 2a and b show the product distribution when P_{CO} is 5 atm, and P_{H₂} is 5 and 2 atm, respectively. These product distributions show the same behavior with H₂/CO ratio as those shown in Figure 1. As the H₂/CO ratio decreases, the y-intercept moves closer to unity, and the lower molecular weight products deviate more from the straight line extrapolated from heavier products. Power law kinetic parameters were determined from these data. The rate of CO consumption is described by the relationship:

$$R_{CO} = k P_{H_2}^{1.03} P_{CO}^{-0.20} \quad (1)$$

Figure 3 shows the rate of CO consumption as a function of 1/T. The power law kinetics determined earlier were used to correct the rates for changes in partial pressures with conversion. The low temperature data are well described by an activation energy of 19.1 kcal/mole. However, at 280°C,

the rate of CO consumption is about 20 percent lower than predicted by extrapolating the low temperature rates.

Figure 4 shows the rate of CO consumption as a function of gas superficial velocity at 280°C. The rates have again been corrected for changes in gas composition with conversion. As the velocity increases from 1.8 cm/sec to 5.2 cm/sec, a 20% increase in the rate of CO consumption is observed.

The reason for the observed deviations from Schulz-Flory product distributions is not clear. Re-adsorption and subsequent incorporation of lower molecular weight olefins into growing chains may account for the apparent suppression of lighter products. Another possibility is that the kinetic parameters that determine the rate of chain growth relative to chain termination depend on the size of the hydrocarbon chain. Further work in this area is required. Addition of low molecular weight olefins to the feed gas may allow us to determine whether olefins adsorb and participate in chain growth.

The increase in CO consumption rate with gas velocity and the deviation of the rate of CO consumption from its expected value at 280°C can both be attributed to mass transfer resistances in the reactor. The expected influence on the rate of CO consumption can be seen by writing the liquid phase mass balance. R_{H_2} is related to R_{CO} by the ratio of the stoichiometric coefficients:

$$R_{H_2} = \frac{v_{H_2}}{v_{CO}} R_{CO}$$

The mass balance is written for H_2 because, as seen in eqn. (1), the rate is not strongly influenced by the CO concentration. In the mass balance shown below, the rate is assumed to be first order in H_2 and independent of CO concentration. This assumption is reasonable, in view of the rate expression in eqn. (1), and allows direct solution for C_{H_2L} .

$$R_{H_2} = k_L a \left(\frac{C_{H_2,G}}{m_{H_2}} - C_{H_2,L} \right) = k_o C_{H_2,L} \quad (2)$$

Solving for $C_{H_2,L}$, and substituting back into equation (2), we obtain:

$$R_{H_2} = \frac{k_L a k_o}{k_o + k_L a} \frac{C_{H_2,G}}{m_{H_2}} \quad (3)$$

When $k_L a \gg k_o$, mass transfer does not influence the rate of reaction, and

$$R_{H_2} = R_{H_2}^{\max} = \frac{k_o C_{H_2,G}}{m_{H_2}} \quad (4)$$

As U_G increases, $k_L a$ increases, but k_o remains constant. Thus, R_{H_2} approaches $R_{H_2}^{\max}$ when U_G is large. When the temperature increases, k_o increases, but $k_L a$ remains nearly constant. At high temperature, then, R_{H_2} is expected to be less than $R_{H_2}^{\max}$.

We can estimate $k_L a$ using equations (3) and (4), along with the experimental values of R_{H_2} and $R_{H_2}^{\max}$. $k_L a$ was estimated to be 0.20 s^{-1} from the variation of R with T and 0.17 s^{-1} from the variation of R with U_G . Both estimates are for a superficial velocity of 1.9 cm/s .

CONCLUSIONS

- 1) We do not observe a Schulz-Floxy product distribution over a $\text{Ru/Al}_2\text{O}_3$ catalyst.
- 2) Mass transfer does not have a strong influence of the rate of the Fischer-Tropsch synthesis in our reactor.
- 3) $k_L a$ for hydrogen is estimated to be 0.19 s^{-1} when the superficial gas velocity is 1.9 cm/sec .

NOMENCLATURE

$C_{H_2,G}$	Gas phase concentration of H_2 , moles/cm ³
$C_{H_2,L}$	Liquid concentration of H_2 , moles/cm ³
k	Rate coefficient, atm ^{-0.83} (moles/cm ³) sec ⁻¹
k_0	First order rate coefficient, sec ⁻¹ .
$k_L a$	Mass transfer coefficient times interfacial area, sec ⁻¹
m_{H_2}	Solubility coefficient for H_2
P_{H_2}	H_2 partial pressure, atm
P_{CO}	CO partial pressure, atm
R_{CO}	Rate of CO consumption, moles CO/sec-cm ³
R_{H_2}	Rate of H_2 consumption, moles H_2 /sec-cm ³
U_G	Gas superficial velocity, cm/sec

This report was printed specifically for your order from nearly 3 million titles available in our collection.

For economy and efficiency, NTIS does not maintain stock of its vast collection of technical reports. Rather, most documents are custom reproduced for each order. Documents that are not in electronic format are reproduced from master archival copies and are the best possible reproductions available.

Occasionally, older master materials may reproduce portions of documents that are not fully legible. If you have questions concerning this document or any order you have placed with NTIS, please call our Customer Service Department at (703) 605-6050.

About NTIS

NTIS collects scientific, technical, engineering, and related business information – then organizes, maintains, and disseminates that information in a variety of formats – including electronic download, online access, CD-ROM, magnetic tape, diskette, multimedia, microfiche and paper.

The NTIS collection of nearly 3 million titles includes reports describing research conducted or sponsored by federal agencies and their contractors; statistical and business information; U.S. military publications; multimedia training products; computer software and electronic databases developed by federal agencies; and technical reports prepared by research organizations worldwide.

For more information about NTIS, visit our Web site at <http://www.ntis.gov>.
