

PROBE MOLECULE STUDIES: ACTIVE SPECIES IN ALCOHOL SYNTHESIS. THIRD QUARTERLY REPORT, APRIL 1991--JUNE 1991

PITTSBURGH UNIV., PA. DEPT. OF CHEMICAL AND PETROLEUM ENGINEERING

JUL 1991

National Technical Information Service

One Source. One Search. One Solution.

Providing Permanent, Easy Access to U.S. Government Information

National Technical Information Service is the nation's largest repository and disseminator of governmentinitiated scientific, technical, engineering, and related business information. The NTIS collection includes almost 3,000,000 information products in a variety of formats: electronic download, online access, CD-ROM, magnetic tape, diskette, multimedia, microfiche and paper.

Search the NTIS Database from 1990 forward

NTIS has upgraded its bibliographic database system and has made all entries since 1990 searchable on **www.ntis.gov.** You now have access to information on more than 600,000 government research information products from this web site.

Link to Full Text Documents at Government Web Sites

Because many Government agencies have their most recent reports available on their own web site, we have added links directly to these reports. When available, you will see a link on the right side of the bibliographic screen.

Download Publications (1997 - Present)

NTIS can now provides the full text of reports as downloadable PDF files. This means that when an agency stops maintaining a report on the web, NTIS will offer a downloadable version. There is a nominal fee for each download for most publications.

Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States Government or any agency thereof. The views and opinions of authors expressed herein do not necessarily state or reflect those of the United States Government or any agency thereof. DOE QUARTERLY REPORT, No.3, April 1991 - June 1991

1. OBJECTIVE AND SCOPE OF WORK

The goal of this research is to develop a better understanding of the mechanisms of formation of alcohols and other oxygenates from syngas over supported catalysts. Different probe molecules are planed to add in situ during the reaction to help delineate reaction path ways and identify reaction intermediate species. The key of our study is to investigate how the species generated by these probe molecules interact with surface species present during oxygenate formation.

CO hydrogenation reactions are being carried out in both the presence and the absence of the probe molecule under conditions which favor the formation of oxygenated products. A reaction and analysis system capable of carrying out the experiments for this study has been set up, modified, and tested.

First, the commercially important Cu/ZnO/Al2O3 catalyst for methanol synthesis is being studied. Other catalysts, such as Pd and Rh with and without alkali or oxide promoters which are known to produce oxygenates from syngas, are being prepared and characterized for this study.

Based on the observation of a previous study that nitromethane is an effective source of CH2 groups, it will be one of the primary probe molecules to be studied. In addition, acetylenic compounds are primary choices for this

DOE QUARTERLY REPORT, No.3, April 1991 - June 1991

٩,

study also. These compounds were found by other workers to be effective as a source of chain initiators.

2. SUMMARY OF PROGRESS

Methanol synthesis reactions over Cu/ZnO/Al2O3 with and without 1-hexyne (C4H9-C=CH) have been carried out. Complete reduction of 1-hexyne (C4H9-C=CH) to n-hexane (C6H14) without significant perturbation of the MeOH synthesis process was observed. Nitromethane (CH3NO2) has been used as the next probe molecule for the same reactions.

Due to problems encountered during this period, the reaction system was modified to allow more effective studies.

3. DETAILED DESCRIPTION OF TECHNICAL PROGRESS

Methanol synthesis reactions over Cu/ZnO/Al2C3 under 350 psi at 250 °C with CO/H2 ratio of 1:1 to 1:4 were carried out to reach a stabilized conversion to MeOH. About 20% 1-Hexyne in cyclohexane was added to the syngas inlet at ~ 0.01 cc/min through the liquid pump.

The typical experimental results are shown in Figure 1. Major observations and problems we have had during this period are stated as below.

Observation 1: 1-Hexyne does not incorporate into the

DOE QUARTERLY REPORT, No.3, April 1991 - June 1991

product during the process of MeOH synthesis over Cu/ZnO/ allo3.

Observation 2: 1-Hexyne was completely reduced to nhexane over Cu/ZnO/Al2O3 under the condition used without disturbing the MeOH formation (see Figure 1).

Problem 1: Without addition of CO2 to the syngas mixture, CO conversion to MeOH under the selected reaction condition is very low.

Problem 2: Operating at the lowest rate of 0.01 cc/min, the syringe pump was still introducing too much liquid into the reactor. Although the solvent used did not show any significant side effect on the reaction path way, it can still affect the surface processes, such as adsorption, cereaction etc. Besides, the low pumping rate makes it hard to operate at a steady flow rate.

In order to obtain more reliable and meaningful results, it was decided to modify the reaction system in order to use a saturator instead of a liquid pump for probe molecule introduction. A schematic of the modified system is shown in Figure 2. In addition, this system allows addition of CO2 for MeOH synthesis over Cu/ZnO/Al2O3 to obtain a standard CO conversion to MeOH.

During this period the saturator was tested with CH3NO2 under various conditions of pressure, temperature and gas flow rate. DOE QUARTERLY REPORT, No.3/ April 1991 - June 1991

G

4. PLANS FOR THE NEXT REPORTING PERIOD

In the next period further studies of MeOH synthesis reaction over Cu/ZnO/Al2O3 wil be performed. CO/CO2/H2, instead of CO/H2, mixture will be used to improve CO conversion. CH3NO2 will be used as the probe molecule.

In order to clarify what happens when CH3NO2 is added to the catalyst surface, enough blank runs have to be performed prior to reactions. This is shown schematically as follows:

e,

No.3,

Figure 1.

 CO conversion to MeOH from CO/H2 (1:3) over Cu/ZnO/Al2O3 at 350 psi, 250 °C, 4000 hr⁻¹ (HGSV) without and with Hexyne (C4H9C=CH) addition.

1: 3-way valve, 2: flow control mater, 3: on/off valve, 4: check valve, 5: pressure gauge, 6: 4-way valve, 7: probe molecule saturator,
8: trap, 9: backup pressure regulator, 10: trap, 11: leaking valve,
12: sampler, 13: 6-way sampling valve, 14: bubble flow meter, 15: catalyst, 16: glass wool, 17: furnace, 18: thermocouple.

Reproduced by NTIS

National Technical Information Service Springfield, VA 22161

This report was printed specifically for your order from nearly 3 million titles available in our collection.

For economy and efficiency, NTIS does not maintain stock of its vast collection of technical reports. Rather, most documents are custom reproduced for each order. Documents that are not in electronic format are reproduced from master archival copies and are the best possible reproductions available.

Occasionally, older master materials may reproduce portions of documents that are not fully legible. If you have questions concerning this document or any order you have placed with NTIS, please call our Customer Service Department at (703) 605-6050.

About NTIS

NTIS collects scientific, technical, engineering, and related business information – then organizes, maintains, and disseminates that information in a variety of formats – including electronic download, online access, CD-ROM, magnetic tape, diskette, multimedia, microfiche and paper.

The NTIS collection of nearly 3 million titles includes reports describing research conducted or sponsored by federal agencies and their contractors; statistical and business information; U.S. military publications; multimedia training products; computer software and electronic databases developed by federal agencies; and technical reports prepared by research organizations worldwide.

For more information about NTIS, visit our Web site at <u>http://www.ntis.gov</u>.
