

*Low Emission Diesel  
Engine Oils  
Conference*

**Post-Combustion Emission Control  
Devices For Diesel Applications**

*By Magdi Khair*

---

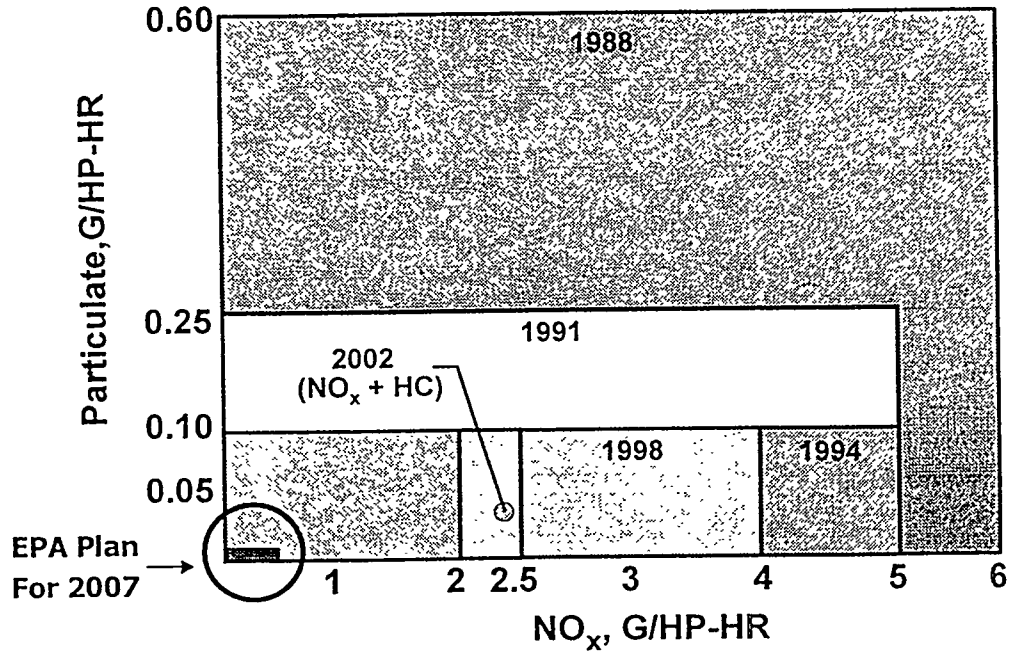

*January 30 - February 1, 2000*

**Presentation Outline**

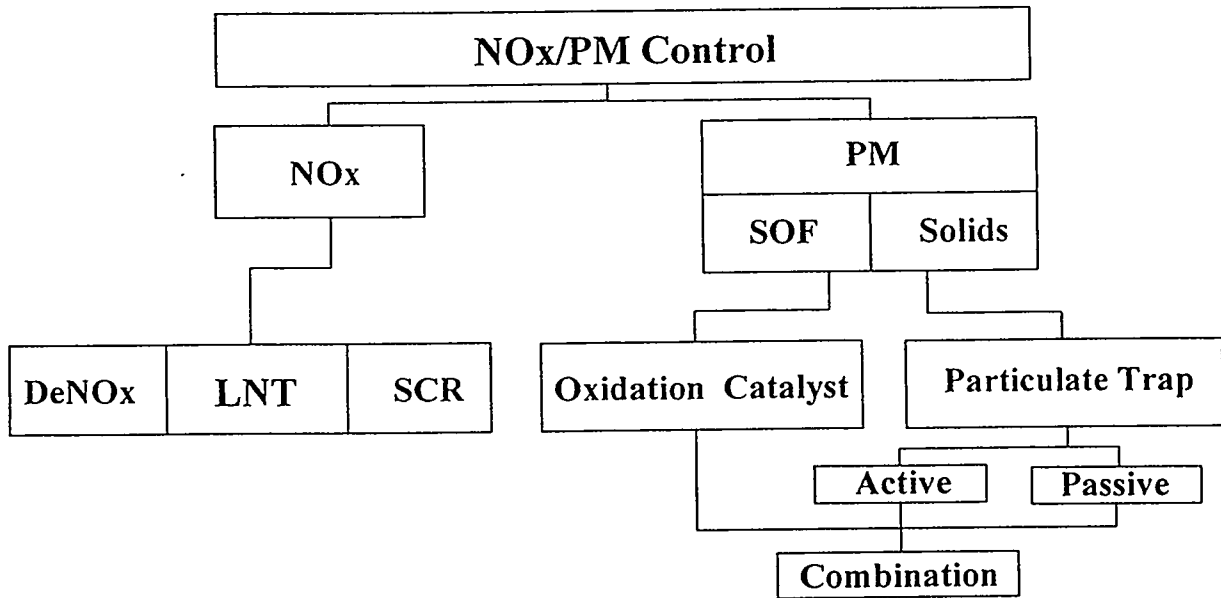

- **Standards, Goals, and Research Targets**
- **Post Combustion Emission Control Devices**
- **Description & Principle of Operation**
- **Advantages and Disadvantages**
- **Summary**
- **Conclusion**

# Standards, Goals, and Research Targets

## Post Combustion Emission Control Technology Options

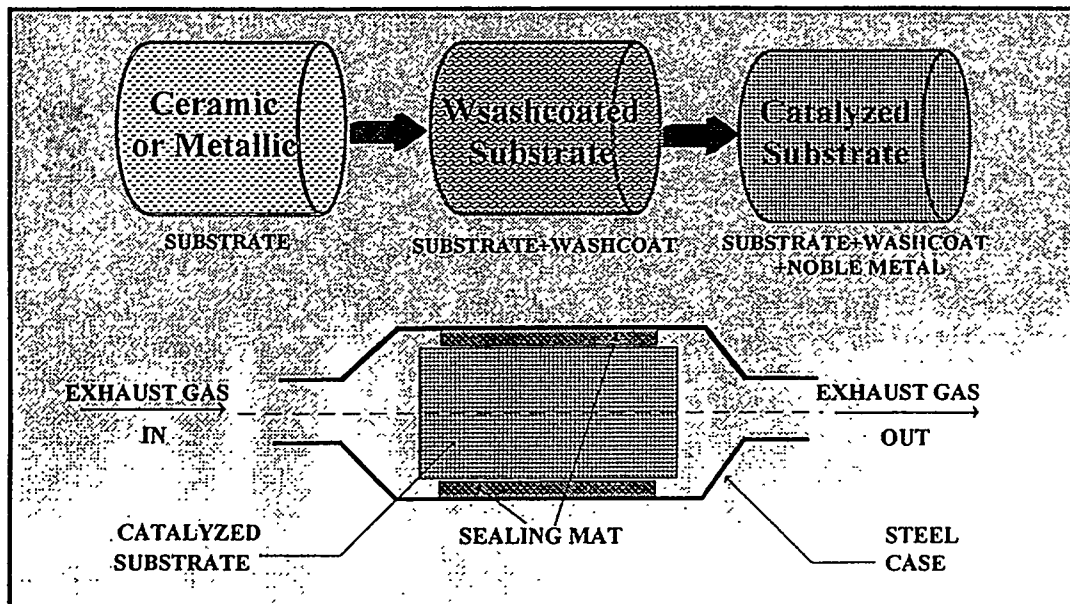

# Post Combustion Emission Control Systems

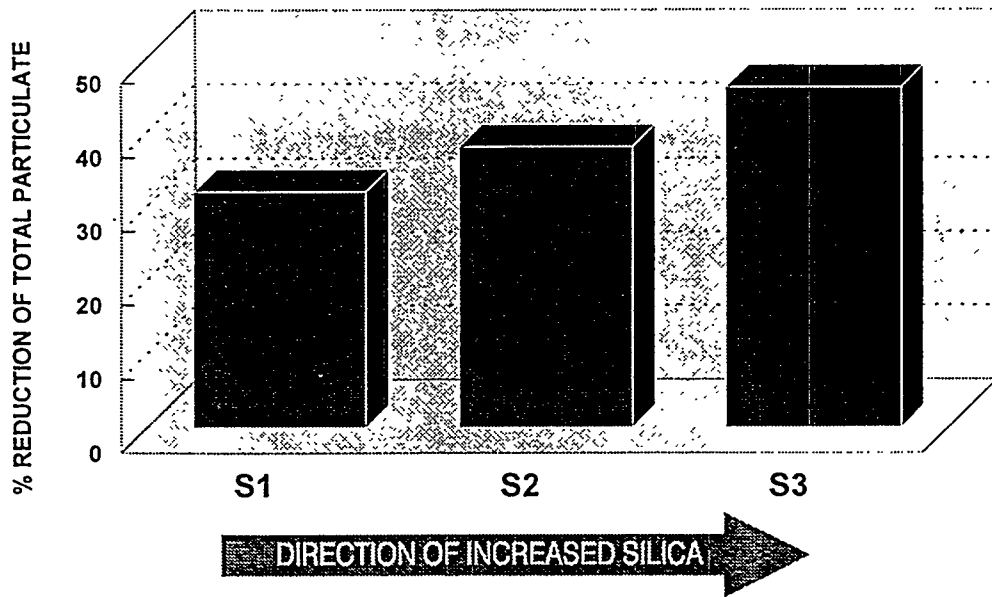

- Diesel Oxidation Catalyst (DOC)
- Diesel Particulate Filters (DPFs or Traps)
- Lean NO<sub>x</sub> Catalyst (LNC)
- Lean NO<sub>x</sub> Trap (LNT)
- Selective Catalytic Reduction (SCR)
- Combinations

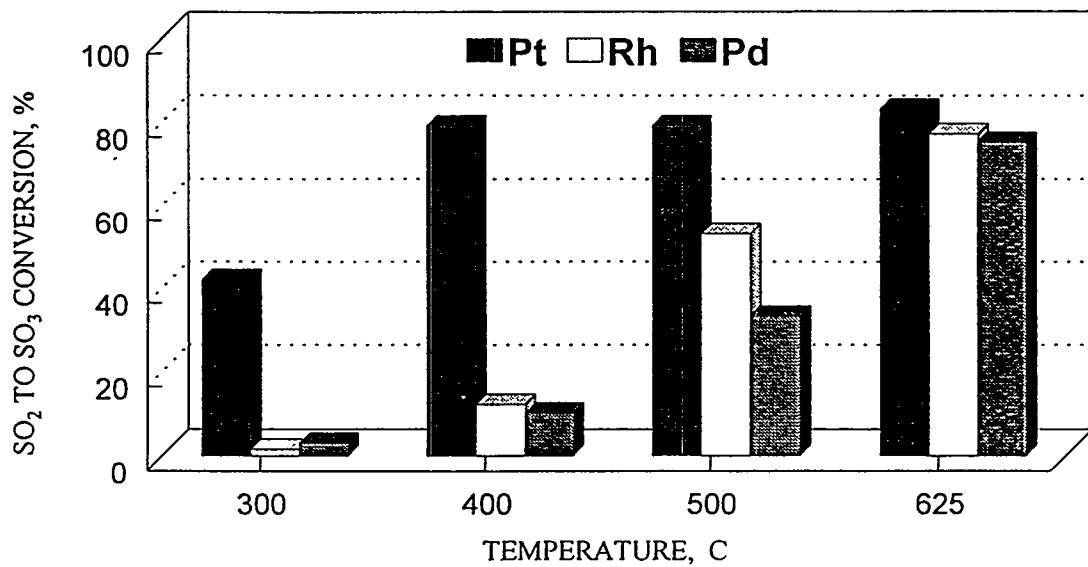

## Diesel Oxidation Catalyst (1)

# Diesel Oxidation Catalyst (3)

# Diesel Oxidation Catalyst (2)

# Diesel Particulate Filters (1)

## Most Common Filter Element Wallflow Construction

# Diesel Particulate Filters (2)

## Methods For Active Regeneration

# Diesel Particulate Filters (3)

## Methods For Passive Regeneration

- With Catalytic Coating Assist

- Self Regenerating

# Diesel Particulate Filters (4)

## Combination Catalyst and Particulate Filter

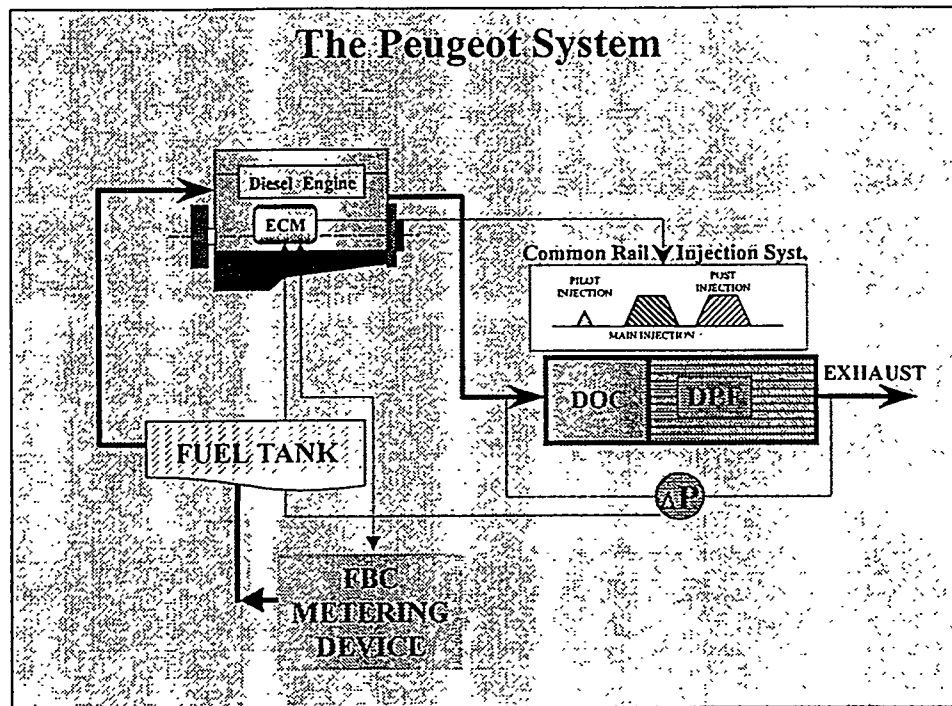

Catalyzed Soot Filter

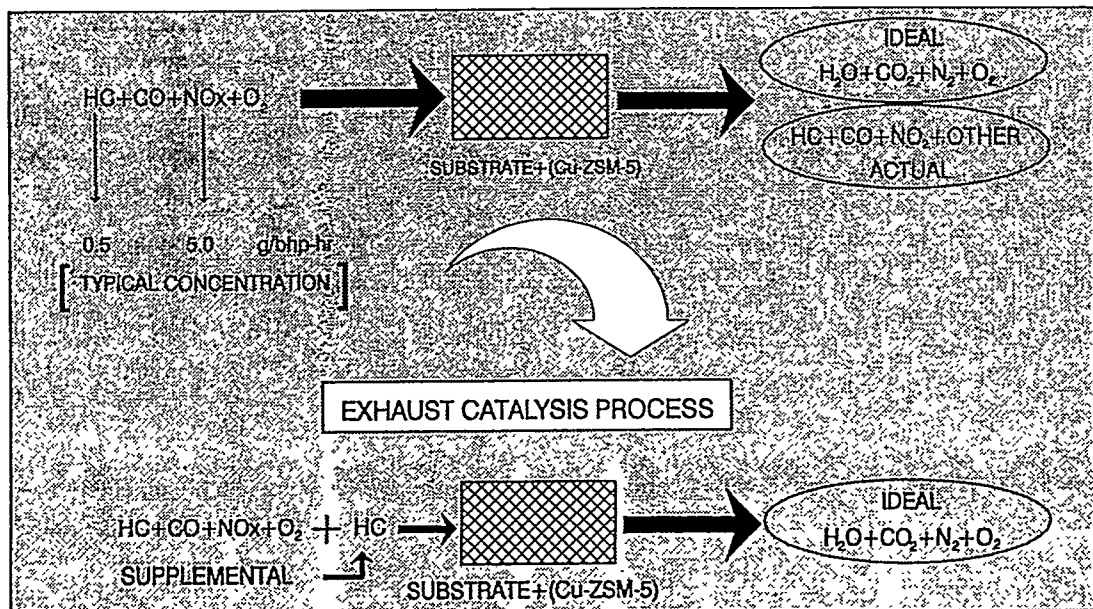

Continuously Regenerated Trap

# Diesel Particulate Filters (5)

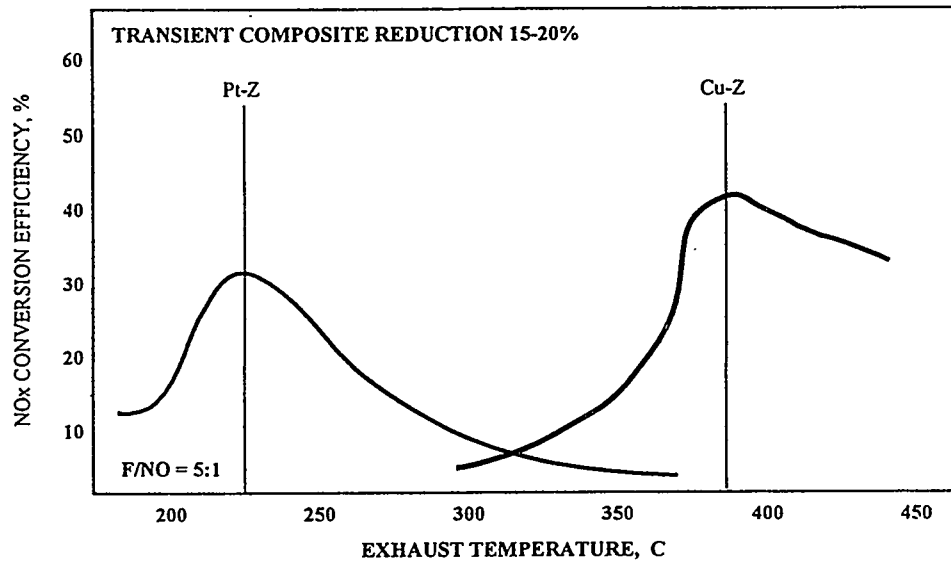

# Lean NOx Catalyst (1)

# Lean NOx Catalyst (2)

(COMPOSITE GENERATED FROM INDUSTRY EXPERIENCE)

# Lean NOx Trap (1)

# Selective Catalytic Reduction

## Advantages and Disadvantages

# Diesel Oxidation Catalyst

## Advantages

- Passive Device for PM Control
- SOF Conversion Eff. of 50-70%
- Some Formulations Show Gas-Phase Activity
- Good Durability
- Proven Reliability

## Disadvantages

- Effective on High SOF Engines Only
- Sulfur Deactivation Concerns
- Lube Oil Additive Package Deactivation Concerns
- Ineffective With EGR Systems
- Highly Active DOCs Can Also Form Sulfate

---

# Diesel Particulate Filters

## Advantages

- Greater Than 90% PM Removal
- Highest Potential For Reducing Fine Particles
- Has Synergistic Value When Used With EGR
- Passive Regeneration Techniques Are Attractive

## Disadvantages

- Cost
- Complex Controls
- Durability and Reliability Concerns
- High Back Pressure
- Potential of Plugging

# Lean NOx Catalyst

## Advantages

- Can Use Same On-Board HC
- Good Resistance to Sulfur
- No Appreciable Hydrothermal Deactivation For Low Temp.
- Some Limited Success For Passive Systems

## Disadvantages

- Low NOx Conversion
- Narrow Temperature Range
- Void of NOx Conversion Between Low and High Temp. Catalysts
- N<sub>2</sub>O Formation With Low T. Cat.
- Lack of Durability of High T. Cat.
- PM & Fuel Consumption Concerns

# Lean NOx Trap

## Advantages

- Experience With DI Gasoline
- Active in 250 - 450°C Range
- Potential For High NOx Conversion (>50%)
- Compatible With Total Engine/Aftertreatment Control Schemes

## Disadvantages

- Serious Sulfur Deactivation
- May Require DOC in Rich Regime
- Relatively New For Diesel Applications
- Requires Sophisticated Controls
- Adverse Impact on Fuel Economy

# Selective Catalytic Reduction

## Advantages

- NOx Conversion of 70%
- Established Technology (Stationary)
- Good Durability at Low- & Mid-Range Temperatures
- Maintain Engine Durability and Performance By Avoiding EGR and Timing Retard

## Disadvantages

- Additional On-Board Fluid
- Requires Sophisticated Controls
- Infrastructure For Urea Distribution
- Ammonia Slip Concerns
- US Regulators Non-Committal--May Have to Carry Life-Time Supply

---

# Combination Systems

## Advantages

- Overcome Limitations of Other Systems
- CRT Technology Holds Good Promise--Requires 50ppm or less Sulfur
- Field Experience With Peugeot system
- Designed to Achieve Extremely Low Emissions

## Disadvantages

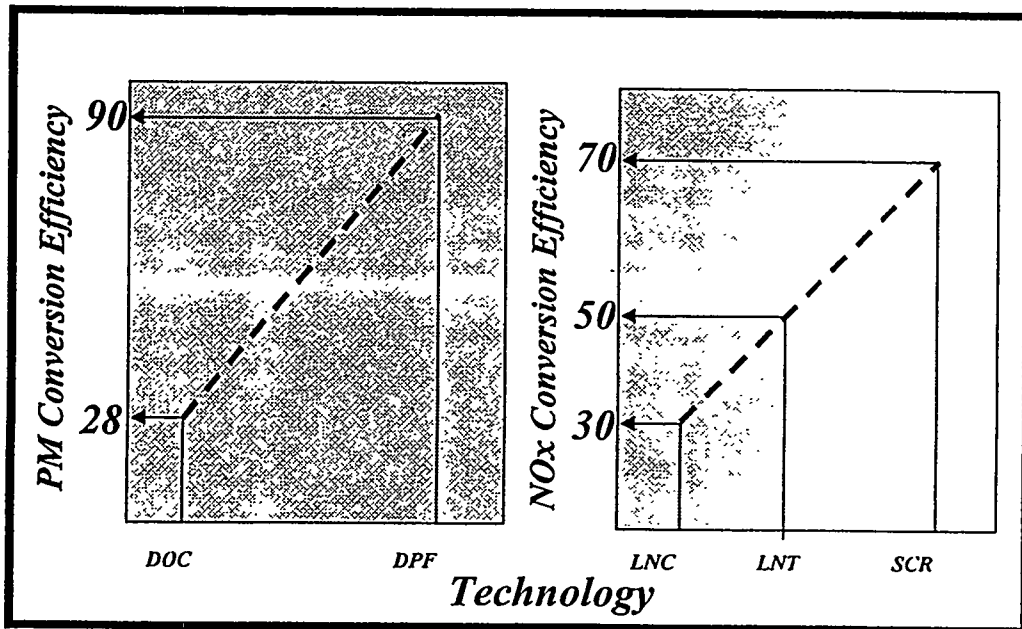

- They Each Have Limitations
- Requires Sophisticated Controls
- Are Application Specific
- CRT's Efficiency and Viability Depends on Availability of Low Sulfur Fuel
- Trap Regeneration Remains a Challenge

# Summary

## Progress in Post Combustion Emissions Reduction Technologies (Summary-1)

# Progress in Post Combustion Emissions Reduction Technologies (Summary-2)

<i>Technology</i>	<i>Pros</i>	<i>Cons</i>
<i>DOC</i>	<i>Passive/Cost/Durability</i>	<i>Low Conv. Efficiency</i>
<i>DPF</i>	<i>Efficiency</i>	<i>Cost/Reliability &amp; Durability</i>
<i>LNC</i>	<i>Reductant Common With Onboard Fuel</i>	<i>Fuel Consumption &amp; Low Conv. Efficiency</i>
<i>LNT</i>	<i>Reductant Common With Onboard Fuel</i>	<i>Unproven-Durability Fuel Consumption-Sulfur</i>
<i>SCR</i>	<i>High NO<sub>x</sub> Conversion</i>	<i>Add. Fluid Onboard/ Cost/Infrastructure...</i>

## Concluding Comments

- There is no clear winner among the various aftertreatment systems
- Trap systems have the potential for PM control but still suffer from high cost, low durability, and low reliability
- CRT appears to have good passive regeneration qualities but requires ultra low sulfur fuel
- LNT for diesel engines is still new and requires more research--We know that it requires very low sulfur content
