Memorandum II

Ref: Removal of the Last Traces of the Phenols Which are Present in the Waste Water

Since October 28 the Multiclone dust is transferred to installation 96 and delivered to the Zeitz factory. Under those conditions the phenol containing waste water, which is leaving the installation 15 and 90 cannot be liberated from the phenols. The result is that the water which leaves the Neustadt-basin contains up to 10 mg/liter phenols, in addition it is of a red color.

In order to make a better use of the dust it will not be utilized for the extraction of the phenols from the waste water. Therefore the following proposals are submitted:

1. A special water line is provided which connects installation 21 with installation 15 and which leads the waste water to the dephenolization plant where the phenols are extracted.
2. The slags from the producers shall be employed for the final dephenolization of the waste water.
